About This Guide

The Linux Volume Manager (NLVM) allows you to use NetWare partitions on an Open Enterprise Server (OES) server. This guide describes NLVM and how to use it with OES Storage Services (NSS) file systems, Linux POSIX file systems, and OES Cluster Services.

- Chapter 1, "Overview of NLVM," on page 9
- Chapter 2, "What's New or Changed in Novell Linux Volume Manager," on page 11
- Chapter 3, "Installing or Upgrading NLVM," on page 13
- Chapter 4, "Using NLVM in a Virtualized Environment," on page 15
- Chapter 5, "Planning for NLVM," on page 17
- Chapter 6, "NLVM Commands," on page 23
- Chapter 7, "NLVM Examples for the NSS File System," on page 119
- Chapter 8, "NLVM Examples for Clustering with OES Cluster Services," on page 125
- Chapter 9, "Troubleshooting NLVM," on page 141
- Chapter 10, "Security Considerations," on page 153
- Appendix A, "Configuring Settings for the NLVM Library," on page 155

Audience

This guide is intended for storage and cluster administrators.

Feedback

We want to hear your comments and suggestions about this manual and the other documentation included with this product. Please use the comment on this topic feature at the bottom of each page of the online documentation.

Documentation Updates

For the most recent version of the OES: NLVM Reference, visit the OES 23.4 website (https://www.microfocus.com/documentation/open-enterprise-server/23.4/stor_nlvm_lx/).

Additional Documentation

For documentation on OES, see the OES 23.4 Documentation website (https://www.microfocus.com/documentation/open-enterprise-server/23.4/).

1 Overview of NLVM

The Novell Linux Volume Manager (NLVM) provides management of OES Storage Services (NSS) storage objects in Open Enterprise Server (OES) server. The command line interface (CLI) commands can be used in a Linux console or in a script. The NSS management tools use the NLVM library of APIs to create and manage NSS storage objects. NLVM also provides options to create Linux POSIX file systems, such as Btrfs, Ext2, Ext3, ReiserFS, and XFS.

This command reference describes how to use command line commands to manage the following storage objects:

- Devices and Partitions
- Linux POSIX Volumes
- NSS Pools
- NSS Pool Snapshots
- NSS Software RAIDs
- NSS Volumes

2 What's New or Changed in Novell Linux Volume Manager

This section describes the changes made to Novell Linux Volume Manager (NLVM) in Open Enterprise Server (OES).

- Section 2.1, "What's New or Changed in NLVM (24.2)," on page 11
- Section 2.2, "What's New or Changed in NLVM (23.4)," on page 11

2.1 What's New or Changed in NLVM (24.2)

NLVM provides the following new NLVM commands in OES 24.2:

- Pool Cacheenable Associate a cache with an existing pool. See, Section 6.12, "Pool Cacheenable," on page 50.
- Pool Cachedisable Disable the associated cache from a pool. See, Section 6.13, "Pool Cachedisable," on page 50.
- **Pool Cachesync** Perform pending modifications to the pool's metadata and cached file data written to the underlying storage pool. See, Section 6.14, "Pool Cachesync," on page 51.

2.2 What's New or Changed in NLVM (23.4)

NLVM provides the following enhancements and changes in OES 23.4:

- Section 2.2.1, "Branding Update," on page 11
- Section 2.2.2, "Cache Devices," on page 12
- Section 2.2.3, "Cache Enabled Pools," on page 12

2.2.1 Branding Update

Micro Focus is now part of OpenText. Products across the portfolio are now rebranded to reflect OpenText or a more appropriate name. This corporate change impacts the name of products and components, user interfaces, logos, and so on. As a result of this corporate change, OES 2023 SP1 is now referred as OES 23.4.

The documentation is being updated in stages to reflect these changes, including names and screenshots. You can still come across references to Micro Focus in the documentation library until all of the manuals are updated.

2.2.2 Cache Devices

Cache Devices (cachedev) are special block devices that are designed for hosting cache for the NSS storage pools. You can group the free storage space available in the fast storage devices to form the cache device. Adding partitions or more devices will allow you to expand the cache device even further. For more information, see Chapter 6, "NLVM Commands," on page 23 and Cache Devices in OES 23.4: NSS File System Administration Guide for Linux.

2.2.3 Cache Enabled Pools

The NSS storage pools can have cache on a specific cache device in order to improve the IO performance. For more information, see Chapter 6, "NLVM Commands," on page 23 and Cache Enabled Pools in OES 23.4: NSS File System Administration Guide for Linux.

3 Installing or Upgrading NLVM

The Novell Linux Volume Manager command line tool and libraries are installed and upgraded by default whenever you install or upgrade OES Storage Services (NSS) on your Open Enterprise Server (OES) 11 or later server. No action is required.

For information about installing NSS on your OES 11 or later server, see "Installing and Configuring OES Storage Services" in the OES 23.4: NSS File System Administration Guide for Linux.

For general information about installing, upgrading, and patching OES Services on your OES 11 or later server, see the OES 23.4: Installation Guide.

4 Using NLVM in a Virtualized Environment

The Novell Linux Volume Manager (NLVM) utility runs in a virtualized environment just as it does on a physical server running Open Enterprise Server 11 and later, and requires no special configuration or other changes.

- For information on setting up virtualized OES, see "Installing OES on a VM" in the OES 23.4: Installation Guide.
- To get started with Xen virtualization, see the Virtualization Guide (https://documentation.suse.com/sles/15-SP4/html/SLES-all/book-virtualization.html).
- To get started with KVM virtualization, see the Virtualization Guide (https://documentation.suse.com/sles/15-SP4/html/SLES-all/book-virtualization.html).
- To get started with third-party virtualization platforms, such as Hyper-V from Microsoft and the different VMware product offerings, refer to the documentation for the product you are using.

For information about using the Novell Linux Volume Manager for OES Storage Services (NSS) volumes in a virtualized environment with Open Enterprise Server 11 and later, refer to the guidelines and requirements in "Using NSS in a Virtualization Environment" in the OES 23.4: NSS File System Administration Guide for Linux.

Planning for NLVM

Consider the requirements and caveats in this section when planning to use Novell Linux Volume Manager (NLVM) command line commands on Open Enterprise Server (OES) servers.

- Section 5.1, "Root User," on page 17
- Section 5.2, "Naming Conventions for Storage Objects," on page 17
- Section 5.3, "NSS Pools on the System Device," on page 20
- Section 5.4, "NSS Pools Created on NetWare Servers," on page 20
- Section 5.5, "NSS Pools Created on Older Versions of OES Servers," on page 20
- Section 5.6, "Linux LVM Volume Group," on page 20
- Section 5.7, "Linux LVM Volume Group Cluster Resources," on page 21
- Section 5.8, "Using NLVM with NSS Software RAIDs," on page 21
- Section 5.9, "Using NLVM with Linux Software RAIDs," on page 21
- Section 5.10, "Using iSCSI Devices with NSS Software RAID5," on page 22
- Section 5.11, "Using Antivirus Software with NCP Volumes," on page 22

5.1 Root User

The Linux system root user privileges are required to use the NLVM commands.

5.2 Naming Conventions for Storage Objects

Consider the naming conventions in this section when you create or rename storage objects with NLVM.

- Section 5.2.1, "NSS Pool and Volume Names," on page 17
- Section 5.2.2, "NSS Pool Snapshot Names," on page 18
- Section 5.2.3, "NSS Software RAID Names," on page 18
- Section 5.2.4, "NCP Volume Names," on page 19
- Section 5.2.5, "Linux LVM Volume Group and Logical Volume Names," on page 19

5.2.1 NSS Pool and Volume Names

OES Storage Services (NSS) pool names and volume names must be unique from other pools and volumes on the server. In a cluster, the names of shared pools and volumes must be unique across all nodes in the cluster.

Pool and volume names can be 2 to 15 characters.

Uppercase letters A to Z, number characters 0 to 9, and underscore (_) are valid characters for all pools and volumes. Names cannot start or end in an underscore, and cannot contain double underscores. When you create an NSS pool or volume, the name you specify is automatically converted to uppercase.

If the pool is not shared, the pool name or volume name can also contain special characters:

!@#\$%&()

Names that contain special characters must be enclosed in quotation marks in all commands and scripts.

The names cannot be reserved names such as con, com, lpt, pipe, all, and so on.

5.2.2 NSS Pool Snapshot Names

An NSS pool snapshot name must be a unique snap name on the server.

Pool snapshot names are 2 to 15 characters.

The naming conventions for a pool snapshot are the same as for NSS pools and volumes. When you create an NSS pool snapshot, the name you specify is automatically converted to uppercase.

5.2.3 NSS Software RAID Names

An NSS software RAID name must be unique from other devices on the server. In a cluster, the names of shared software RAIDs must be unique across all nodes in the cluster.

RAID names are 2 to 58 characters.

Names are preferred to use characters A to Z, a to z, 0 to 9, and underscore (_). Names cannot start or end in underscore, and cannot contain double underscores. Printable ASCII characters (see decimal codes 33 to 122 in a code chart) are valid. The name is case sensitive; it can contain uppercase and lowercase characters.

RAID names can contain special characters such as:

!@#\$%&()

Names that contain special characters must be enclosed in quotation marks in all commands and scripts. On the BASH command line, each special character must be escaped by preceding it with a backslash character (\).

The RAID names cannot be reserved names such as con, com, lpt, pipe, all, and so on.

5.2.4 NCP Volume Names

NCP volume names can be up to 14 alphanumeric characters, using uppercase letters A through Z and numbers 0 through 9. Underscores (_) are allowed.

If you NCP enable a Linux volume as you create it with NSSMU or the nlvm create linux volume command, the NCP volume name is based on the specified Linux volume name, but all letters are capitalized. Ensure that the specified Linux volume name does not exceed 14 characters and does not use special characters. Letters A-Z, letters a-z, numbers 0-9, and underscores are supported.

5.2.5 Linux LVM Volume Group and Logical Volume Names

Consider the following conventions for naming Linux Logical Volume Manager (LVM) volume groups and logical volumes:

- "NLVM Requirements for LVM Names" on page 19
- "LVM2 Requirements for LVM Names" on page 19
- "Clustered LVM Requirements for LVM Names" on page 20

NLVM Requirements for LVM Names

NLVM requires that Linux LVM volume group names and logical volume names be unique from any volume, device, pool, RAID, and other Device Mapper name. The LVM group name is limited to 128 characters. The LVM logical volume name is limited to 64 characters.

When you create a Linux LVM logical volume without specifying an LVM volume group name, NLVM assigns the volume name to the volume group.

LVM2 Requirements for LVM Names

LVM2 allows volume group names and logical volume names to contain characters A to Z, a to z, 0 to 9, underscore (_), hyphen (-), dot (.), and plus (+). The names cannot begin with a hyphen.

Reserved names and character strings that are used internally by LVM cannot be used as volume group names or logical volume names. A volume group cannot be called anything that exists in / dev/ at the time of creation. It cannot be named '.' (a single dot) or '..' (double dot).

A logical volume cannot be named the following reserved words:

```
. (a single dot)
.. (double dot)
snapshot
pvmove
```

The logical volume name also cannot contain the following strings:

```
_mlog
_mimage
```

Clustered LVM Requirements for LVM Names

In a OES Cluster Services cluster, the names of clustered LVM volume groups and logical volumes must be unique across all nodes in the cluster.

5.3 NSS Pools on the System Device

You can create an NSS pool on the system device where you installed the operating system if there is free space available on the device. This capability is not supported at install time. When you create the pool, select the system device (such as sda) and specify the amount of free space to use for the pool.

5.4 NSS Pools Created on NetWare Servers

NLVM is compatible with NSS pools that were created on NetWare servers.

For information about relocating a pool from a standalone NetWare server to an OES 2018 or later server, see "Migrating NSS Devices to OES 23.4" in the OES 23.4: NSS File System Administration Guide for Linux.

For information about cluster migrating a shared pool cluster resource to an OES 2018 or later node during a rolling cluster conversion, see the OES 2015 SP1: Novell Cluster Services NetWare to Linux Conversion Guide.

5.5 NSS Pools Created on Older Versions of OES Servers

NLVM is compatible with NSS pools that were created on older versions of OES servers.

For information about relocating a pool from NetWare to an OES 2018 or later server, see "Migrating NSS Devices to OES 23.4" in the OES 23.4: NSS File System Administration Guide for Linux.

For information about cluster migrating a shared pool cluster resource to an OES 2018 or later node during a rolling cluster upgrade, see "Upgrading OES Clusters" in the OES 23.4: OES Cluster Services for Linux Administration Guide.

5.6 Linux LVM Volume Group

NLVM uses the Linux Logical Volume Manager to create volume groups. LVM requires that the devices you use to create a volume group are already initialized and contain no partitions. LVM uses the entire device for the volume group.

5.7 Linux LVM Volume Group Cluster Resources

OES Cluster Services, NLVM, and NSSMU use the Clustered Logical Volume Manager (CLVM) to manage LVM volume group cluster resources. CLVM requires the Linux kernel 2.6.32.45-0.3 or later. You can get the latest kernel version by using the SLES 15 SP4 update channel.

When you create clustered LVM volume groups on shared storage, all of the nodes in the cluster must have shared physical access to the devices that you want to use to create the volume group. A quorum of nodes must be present in the cluster. The volume group cluster resource is brought online on only one node at a time.

LVM requires that the devices you use to create a volume group are already initialized and contain no partitions. In a cluster, a device should be physically attached to all nodes in a cluster. The device must not be marked as Shareable for Clustering because that adds a 4 KB partition on the device to store the shared state. LVM uses the entire device for the volume group.

5.8 Using NLVM with NSS Software RAIDs

NSS software RAIDs are supported for use with NSS pools. You can use the nlvm create raid command with type=sbd to mirror an SBD partition on two shared LUN devices for the OES Cluster Services SBD (split-brain-detector). The sbd type for a software RAID1 is also used by the OES Cluster Services SBD Utility (sbdutil) to mirror the SBD partition.

IMPORTANT: Do not create linux partitions (or any non-Novell type partition) on an NSS software RAID device. Doing so causes all pool creations on that RAID device to fail.

5.9 Using NLVM with Linux Software RAIDs

Linux Software RAIDs are intended to be used with Linux tools and file systems. Consider the caveats in this section before implementing Linux Software RAIDS on your OES server.

- Section 5.9.1, "Linux Software RAIDs," on page 21
- Section 5.9.2, "Linux Software RAIDs Are Not Cluster Aware," on page 22
- Section 5.9.3, "Linux Software RAIDs Are Not Recommended for the System Device," on page 22

5.9.1 Linux Software RAIDs

We recommend that you do not use Linux software RAIDs (such as MD RAIDs and Device Mapper RAIDs) for devices that you plan to use for storage objects that are managed by NSS management tools. The Novell Linux Volume Manager (NLVM) utility and the NSS Management Utility (NSSMU) list Linux software RAID devices that you have created by using Linux tools. In OES 11 SP1 and later, NLVM and NSSMU can see these devices, initialize them, and allow you to create storage objects on them. However, this capability has not yet been fully tested.

IMPORTANT: In OES 11 or later, a server hang or crash can occur if you attempt to use a Linux software RAID when you create storage objects that are managed by NSS management tools.

For NSS pools, you can use hardware RAID devices or NSS Software RAID devices to achieve disk fault tolerance.

For Linux POSIX volumes, LVM volume groups, and cLVM volume groups, you can use hardware RAID devices on your storage subsystem to achieve disk fault tolerance.

5.9.2 Linux Software RAIDs Are Not Cluster Aware

Do not use Linux Software RAIDs for devices that you plan to use for shared storage objects. Linux Software RAID devices do not support concurrent activation on multiple nodes; that is, they are not cluster aware. They cannot be used for shared-disk storage objects, such as the OCFS2 file system, cLVM volume groups, and OES Cluster Services SBD (split-brain-detector) partitions.

For shared disks, you can use hardware RAID devices on your storage subsystem to achieve fault tolerance.

5.9.3 Linux Software RAIDs Are Not Recommended for the System Device

We recommend that you do not use Linux software RAIDs (such as MD RAIDs and Device Mapper RAIDs) on the system device if you plan to use free space on the device later for storage objects managed by NSS tools. During the SLES and OES installation, if you create a Linux software RAID device to use as the system device for the root (/) file system, the free space on the system device cannot be used later for NSS pools because the configuration of NSS storage objects on Linux software RAIDs has not yet been fully tested.

IMPORTANT: In OES 11, a server hang or crash can occur if you attempt to use a Linux software RAID when you create storage objects that are managed by NSS management tools.

For the Linux system device, you can use a hardware RAID device to achieve fault tolerance. This allows NSS tools to see and use any available free space on the system device for unshared NSS pools.

5.10 Using iSCSI Devices with NSS Software RAID5

Using iSCSI devices on the iSCSI initiator server to create NSS software RAID5 devices can cause poor performance. If you would like RAID5 protection, create the RAID5 on the target server and present that RAID device to the initiator as a single iSCSI device.

5.11 Using Antivirus Software with NCP Volumes

For information about using antivirus software with NCP volumes, see "List of Antivirus Software" in the OES 23.4: Planning and Implementation Guide.

6 NLVM Commands

The Novell Linux Volume Manager (NLVM) command line interface (CLI) for Open Enterprise Server (OES) provides commands that can be used in a Linux console or in a script. The OES Storage Services (NSS) management tools use NLVM to create and manage NSS storage objects. NLVM provides options to create Linux POSIX file systems, such as Btrfs, Ext2, Ext3, ReiserFS, and XFS.

This section describes the syntax and usage for NLVM commands.

- General Options
- Devices and Partitions
- Linux POSIX Volumes
- NSS Pools
- NSS Pool Snapshots
- NSS Software RAIDs
- NSS Volumes
- All NLVM Commands (A to Z)

General Options

- Section 6.1, "Syntax Overview," on page 27
- Section 6.2, "NLVM Options," on page 29
- Section 6.3, "Common Options," on page 30

Devices and Partitions

- Section 6.6, "Create Partition," on page 36
- Section 6.17, "Delete Partition," on page 53
- Section 6.24, "Expand Partition," on page 58
- Section 6.30, "Init Device," on page 62
- Section 6.31, "Label," on page 64
- Section 6.34, "List Device," on page 66
- Section 6.35, "List Devices," on page 69
- Section 6.40, "List Partition," on page 82
- Section 6.41, "List Partitions," on page 84
- Section 6.53, "RAID," on page 109
- Section 6.58, "Rescan," on page 114
- Section 6.60, "Share," on page 115
- Section 6.62, "Unshare," on page 116

Linux POSIX Volumes

- Section 6.5, "Create Linux Volume," on page 31
- Section 6.15, "Delete Linux Volume," on page 51
- Section 6.32, "Linux Mount," on page 65
- Section 6.33, "Linux Unmount," on page 66
- Section 6.36, "List Linux Volume," on page 74
- Section 6.37, "List Linux Volumes," on page 76

NSS Pools

- Section 6.4, "Complete Move," on page 31
- Section 6.7, "Create Pool," on page 38
- Section 6.16, "Delete Move," on page 52
- Section 6.18, "Delete Pool," on page 54
- Section 6.25, "Expand Pool," on page 59
- Section 6.28, "Fstrim Pool," on page 61
- Section 6.38, "List Move," on page 78
- Section 6.39, "List Moves," on page 80
- Section 6.42, "List Pool," on page 90
- Section 6.43, "List Pools," on page 93
- Section 6.48, "Mount," on page 105
- Section 6.49, "Move," on page 106
- Section 6.50, "Pause Move," on page 108
- Section 6.51, "Pool Activate," on page 108
- Section 6.52, "Pool Deactivate," on page 109
- Section 6.54, "Rename Pool," on page 111
- Section 6.58, "Rescan," on page 114
- Section 6.59, "Resume Move," on page 114
- Section 6.61, "Unmount," on page 116

NSS Pool Snapshots

- Section 6.9, "Create Snap," on page 45
- Section 6.22, "Delete Snap," on page 57
- Section 6.44, "List Snap," on page 97
- Section 6.45, "List Snaps," on page 99

NSS Software RAIDs

- Section 6.8, "Create RAID," on page 42
- Section 6.20, "Delete RAID," on page 55

- Section 6.21, "Delete RAID Segment," on page 56
- Section 6.27, "Expand RAID," on page 61
- Section 6.53, "RAID," on page 109
- Section 6.56, "Rename RAID," on page 113

NSS Volumes

- Section 6.10, "Create Volume," on page 47

6.1 Syntax Overview

Novell Linux Volume Manager can be used to manage NSS file systems or Linux POSIX file systems on your OES server. This section describes the general syntax and conventions for NLVM.

- Section 6.1.1, "Syntax," on page 27
- Section 6.1.2, "Syntax Conventions," on page 27
- Section 6.1.3, "Documentation Conventions," on page 28
- Section 6.1.4, "Files," on page 28

6.1.1 Syntax

Using commands for the NLVM program requires root user privileges. NLVM options must follow immediately after nlvm.

nlvm [nlvm_options] <command> <command_options>

6.1.2 Syntax Conventions

When issuing NLVM commands, consider the following general syntax conventions:

- "NSS Pool and Volume Names" on page 27
- "NSS Software RAID Names" on page 27
- "NCP Volume Names" on page 27
- "Order of Command Options" on page 28
- "Sizes" on page 28
- "Name Format" on page 28

NSS Pool and Volume Names

All NSS pool names and NSS volume names are automatically converted to uppercase.

NSS Software RAID Names

NSS software RAID names are case sensitive.

NCP Volume Names

When you create an NCP volume, the name is automatically converted to uppercase.

Order of Command Options

Command options can be specified in any order except where it is otherwise noted. Options with an equal sign (=) can be in any order.

Sizes

All sizes are in bytes and can be specified with one of the following multipliers: K, M, G, and T. Multipliers are case insensitive and are multiples of 1024. If no multiplier is specified, it is assumed to be G by default. If 'max' is entered, all of the free unpartitioned space on the device is used. All sizes can be entered as whole numbers or with fractional parts such as 200.45G and 3.98T.

Examples for common command options:

size=20 (If no multiplier is used, it is assumed to be G (gigabytes).)

size=20G (You can also specify max instead of a value and multiplier.)

size=3.98T (You can specify a value with decimal places.)

Name Format

Examples for common name formats used in command options:

device=sdb (You can specify the leaf node name of the device, including multipath names.)

device=/dev/mapper/mpatha (You can specify the full Linux path of the device.)

device=anydisk (You can specify anydisk or anyshared keywords if the command allows it.)

part=sdc1.1 (You can specify only the partition node name, not the full Linux path.)

part=cluster1.sbd

name=MYPOOL1 (All NSS pool names and NSS volume names are converted to uppercase.)

6.1.3 Documentation Conventions

In the command syntax for NLVM, the mandatory command options are surrounded by angle brackets (<>). The optional command options are surrounded by square brackets ([]). The brackets are not used when you issue the command. For example, the command syntax conventions are:

nlvm [nlvm_options] command <mandatory_value> [options]

6.1.4 Files

The following are key files used by NLVM:

/etc/opt/novell/nss/nlvm.conf

Location of the NLVM configuration file.

/opt/novell/nss/sbin/nlvm

Location of the NLVM utility. It also has a link in the sbin directory so that it is in the search path.

/var/opt/novell/nss/debug

Location of the debug log files.

6.2 NLVM Options

The NLVM options can be used as needed with any command, except where it is otherwise noted. NLVM options can appear in any order in the command after nlvm.

nlvm [nlvm_option] <command> [command_options]

- -d, --debug
- -f, --force
- -l, --getlock
- -m
- --no-prompt
- -r, --rescan
- -s, --share
- -t, --terse
- ٠

-d, --debug

This option causes a /var/opt/novell/log/nss/debug/nlvm_debug.log file to be created so that the operations can be reviewed. This is helpful in diagnosing problems in running the NLVM utility. Up to 10 debug files can be created; they are numbered automatically.

NOTE: The debug can be turned on always by using the /etc/opt/novell/nss/nlvm.conf file.

-f, --force

This option can be used with certain commands to force the command to complete. Support for this NLVM option is indicated in the individual commands.

-1, --getlock

This option forces the command to get the nlvm lock. The lock protects multiple users from modifying things at the same time.

Use with caution! This option is to be used only if the lock does not get released properly due to a segment fault or other operation aborts.

-m

This option prevents pools that have been unmounted from being mounted.

Pools are by design auto mounted. Therefore, running the nssmu utility, or running most nlvm commands without the -m option can cause an unmounted pool to be remounted if underlying devices and partitions still exist. To execute an nlvm command without mounting the unmounted pools, you must include the -m option. The nlvm mount command internally sets the -m flag, so only the specified pool is mounted.

--no-prompt

This option can be used with certain commands to prevent a confirmation message from being displayed, such as when you initialize a device or delete Linux POSIX volumes, pool moves, partitions, pools, RAIDs, RAID segments, snapshots, and NSS volumes. Support for this NLVM option is indicated in the individual commands.

-r, --rescan

This option forces a fresh rescan of the system before executing a command to update the device and partition objects. Use this if something changed the information outside the NSSMU, iManager, or nlvm utility.

-s, --share

This option sets the shared override bit for the command being executed.

In a OES Cluster Services cluster, NLVM uses the cluster's SBD to detect if a node is a cluster member and to lock against concurrent changes to physically shared storage. Without an SBD, NLVM cannot detect whether a node is a member of the cluster and cannot acquire the locks it needs to execute tasks. In this state, you can use the -s option with NLVM commands to prepare a device and create an SBD partition. To minimize the risk of corruption, you must ensure that nobody else is changing any storage on any nodes at the same time.

-t, --terse

This option can be used with nlvm list commands to display the output in a format for parsing. Values are labeled in the format ParameterName=value. Information about a storage object is output in a single line. The line wraps automatically if the output exceeds the console width.

A request might return multiple lines if the target object contains storage objects, such as partitions on a device or segments in a software RAID. The target object's information appears on the first line, and subsequent lines contain information about each of its member objects. A single blank line separates output for some target objects.

-p

This option can be used to display all size outputs in the specified human-readable unit of size, as follows: -pk=kilobytes (KB), -pm=megabytes (MB), -pg=gigabytes (GB), -pt=terabytes (TB), -pp=petabytes (PB), -ps=sectors, or -pb=bytes.

6.3 Common Options

Common options can be used as noted with specific commands. Common options are specified at the end of the command.

- all
- more

all

This option can be used with nlvm list commands to display detailed information for all objects of that type on the server. It displays the same information as a specific nlvm list request against an object. It can be used with the -t or --terse NLVM option to format the detailed output for parsing.

more

This option can be used with nlvm list commands to display more information than appears in the standard output. It can be used with the -t or --terse NLVM option to format the enhanced output for parsing.

6.4 Complete Move

complete move <move_name>

Check to see if an NSS pool move is complete. If the move is complete, the old location is deleted. If the move is not completed, it will return an error 11 (EAGAIN).

If a pool is cluster-enabled, issue the command on the node where its pool cluster resource is currently online.

nlvm [nlvm_options] complete move <move_name>

Command Option

move_name

Mandatory. Specify the name of the move object to check. The move name typically looks like POOLNAME_move.

Command Example

nlvm complete move MYPOOL1_move

Verify that the move MPOOL1_move is complete. If it is, delete the old location of the pool.

6.5 Create Linux Volume

create linux volume <type> <<device> [size] | <part>> [mp] [mkopt] [mntopt] [lvm] [name] [group] [shared] [ip] [ncp] [volid]

Create a Linux POSIX volume on a device.

```
nlvm [nlvm_options] create linux volume <type> <<device> [size] |
<part>> [mp] [mkopt] [mntopt] [lvm] [name] [group] [shared] [ip] [ncp]
[volid]
```

For a cluster-enabled LVM volume, issue the command from the master node in the cluster.

Command Options

type=fstype

Mandatory. Specify the type of Linux POSIX file system to use for mkfs.

Supported file system types are btrfs (in OES 11 SP1 and later; requires the btrfsprogs package), ext2, ext3, ext4, reiserfs, and xfs.

Examples

```
type=ext3
type=reiserfs
```

device=<devicename|anydisk>

Mandatory unless the part option is used. Specify the device to use for the Linux POSIX volume, or specify the keyword anydisk.

IMPORTANT: NLVM does not support using Linux software RAID devices or NSS software RAID devices with Linux POSIX file systems. You can use a hardware RAID device to achieve device fault tolerance for Linux POSIX volumes.

If the device is seen by a single server, or a single node in a cluster, do not use the shared option.

If the device is seen by multiple nodes in a OES Cluster Services cluster, you must specify the *devicename* and use the shared, ip, name, lvm, and group (optional) options to create the Linux volume group cluster resource. Specify an unshared initialized device. For OES 11 SP2 and later, you can alternatively specify a shared device with no data partitions or an uninitialized device. The cluster-enabled LVM volume group uses the entire device. OES Cluster Services mounts the cluster resource exclusively on one node at a time.

Examples

```
device=sdb
device=/dev/sdb
device=anydisk
device=mpatha
device=/dev/mapper/mpatha
```

size=<value[K|M|G|T]|max>

Mandatory unless the shared option is used, or unless the part option is used instead of the device option. Specify a size of the partition to create for the Linux volume, or specify max to use all of the free unpartitioned space for the volume. The minimum allowed size is 8 MB.

If the shared option is used, the entire device is dedicated to the LVM volume group. If the size option is specified, it is ignored.

If the part option is used, the entire partition is dedicated to the volume. If the size option is specified, it is ignored.

Examples

```
size=20G
size=100m
size=max
```

part=partition_name

Specify the node name (such as sdc2) for the partition you want to use for a non-clustered volume. The partition must exist; it is not created with this command. The partition type must be compatible with the type of Linux volume you want to create on it, such as type 83 for a Linux native volume or type 8E for a Linux LVM volume. The entire partition is used for the volume you create.

Do not specify the part option in combination with the device option. The size option is ignored.

Do not specify the ${\tt part}$ option in combination with the ${\tt shared}$ option. You can use a partition only for non-clustered volumes.

Example

part=sdc2

mp=</mount_path>

Specify the path of the mount point where the volume is to be mounted. If the path does not currently exist, it will be created.

For LVM volumes, the name option must be used with the lvm option to specify a volume name. The full mount point path can specify a directory path that is the same or different than the specified volume name. If a mount path is not specified for an LVM volume or a clustered LVM volume, the utility assigns a default mount path of /usr/novell/ <volume_name>.

For Linux POSIX volumes, the final directory of the full mount point path is used as the volume name. For example, if the mount point is /home/users/bob, the volume name is bob. The final directory name must be unique as a volume name on the server. If you use the ncp option, the NCP volume name is based on the final directory name, but all letters are capitalized. Ensure that the final directory name does not exceed 14 characters and does not use special characters. Letters A-Z, letters a-z, numbers 0-9, and underscores are supported.

If a mount path is not specified for a Linux POSIX volume, the utility assigns a default mount path of /usr/novell/<file_system_type>_<next_available_number>. For example, if the file system type is ext3, the default mount path is /usr/novell/ ext3_0. If that path is not available, the path is /usr/novell/ext3_1, and so forth until a unique volume name is achieved.

Example

mp=/home

mkopt=<option1[,option2,...]>

Specify the options to use when running mkfs. For a list of available options, see the mkfs(8) man page. No default option is specified.

Example

mkopt=-v

mntopt=<option1[,option2[],...]>

Specify the options to use when mounting the volume. For a list of available options, see the mount (8) man page. The default mntopt value is rw.

Example

mntopt=rw

lvm

Used to specify that an LVM volume and volume group is to be created.

If the lvm option is used, the name option must be provided to specify a name for the LVM volume. Specifying a different name for the LVM volume group is optional.

Example

lvm

name=<lvm_volume_name>

Used with the lvm option to specify a name for the LVM volume.

If you do not specify the group option, this name is also used as the LVM volume group name.

For LVM logical volume naming conventions, see Section 5.2.5, "Linux LVM Volume Group and Logical Volume Names," on page 19. If you use the ncp option, the NCP volume name is based on the LVM volume name, but all letters are capitalized. Ensure that the name does not exceed 14 characters and does not use special characters. Letters A-Z, letters a-z, numbers 0-9, and underscores are supported.

If the lvm option is not specified, this option is ignored.

Example

name=mylvmvol1

group=<lvm_volume_group_name>

Optional. Used with the lvm option to specify a name for the LVM volume group. If the group option is not specified, the volume group name is the same as the LVM volume name.

For LVM volume group naming conventions, see Section 5.2.5, "Linux LVM Volume Group and Logical Volume Names," on page 19.

If the lvm option is not specified, this option is ignored.

Example

group=clustervg01

shared

Used to cluster-enable an LVM volume group. This creates an LVM volume group cluster resource, including its load, unload, and monitoring scripts, for use in an existing OES Cluster Services cluster. The cluster resource name is the LVM volume group name plus _resource; that is, <lvm_vg_name>_resource. For example, mylvmvg01_resource. The resource is created and set to an Offline state. You can use the Clusters plug-in in iManager to modify the scripts and resource settings as needed, and then use iManager or cluster commands to online the resource.

If the shared option is used, the ip, name, and lvm options must also be provided. You can use the group option to specify a different name for the LVM volume group.

The device must be uninitialized and not marked as shareable. If the device is already initialized, then the device must be uninitialized using the following command:

```
/sbin/wipefs -fa <device>
```

CAUTION: This command completely removes all the existing data or file system.

The LVM volume group uses the entire device. Use OES Cluster Services tools or commands to online the cluster resource exclusively on one node at a time

Examples

```
shared lvm ip=10.10.10.101 name=mylvmvol1
shared lvm ip=10.10.10.101 name=mylvmvol1 group=mylvmvg1
```

ip=<IP_address_for_LVM_volgroup_cluster_resource>

Used with the shared option to specify the IP address to use for the Linux volume group cluster resource. This is required for cluster-enabled Linux volume groups on OES Cluster Services clusters. Specify the IP address in IPv4 format.

If the shared option is not specified, this option is ignored.

Example

ip=10.10.10.101

ncp

Used to enable the Linux POSIX file system on the volume to be accessed with the NetWare Control Protocol (NCP). An NCP volume ID is assigned automatically to the volume. You can use the volid option in combination with the shared and ncp options to assign an NCP volume ID for a clustered LVM volume.

If you use the ncp option, the volume name used for the name option must comply with the name limitations described in Section 5.2.4, "NCP Volume Names," on page 19.

volid=value

(Optional) Used in combination with the shared and ncp options to assign an NCP volume ID for a clustered LVM volume. If the volid option is not used, a volume ID is automatically assigned. For clustered volumes, the valid range is 254 to 0, in descending order.

In a OES Cluster Services cluster, the volume ID must be unique across all member nodes. In a Business Continuity Cluster, the volume ID must be unique across all nodes in every peer cluster.

Example

lvm shared ip=10.10.10.134 name=lvmvol40 ncp volid=240

The volid option requires the shared and ncp options. The shared option requires the lvm, ip, and name options.

Command Examples

nlvm create linux volume type=ext3 device=sdf size=10G mp=/home/bob
mntopt=rw

Create a 10 GB Linux POSIX volume using the Ext3 file system on the /dev/sdf device. Mount the volume on path /home/bob with the Read/Write mount option.

nlvm create linux volume type=ext3 device=/dev/sdf mp=/home/bob
mntopt=rw lvm shared ip=10.10.10.101 group=clustervgbob
name=clustervolbob

Create and cluster-enable an LVM volume group on the /dev/sdf device with a resource IP address of 10.10.10.101, an LVM volume name of clustervolbob, and an LVM volume group name of clustervgbob. Create a Linux POSIX volume on the LVM volume using the Ext3 file system. The entire device is dedicated to the LVM volume.

This command automatically creates an LVM volume group cluster resource called clustervgbob_resource in a OES Cluster Services cluster where the node is a member. It creates its resource load, unload, and monitoring scripts; sets the resource to offline; and waits to be brought online by using the cluster commands. You manage the resource by using OES Cluster Services tools and commands. nlvm create linux volume type=ext3 device=sdf mp=/home/bob mntopt=rw lvm shared ip=10.10.10.101 group=clustervgbob name=clustervolbob ncp volid=240

Create and cluster-enable an LVM volume group on the /dev/sdf device with a resource IP address of 10.10.10.101, an LVM volume group name of clustervgbob, and an LVM volume name of clustervolbob. Create a Linux POSIX volume on the LVM volume using the Ext3 file system. The entire device is dedicated to the LVM volume.

NCP-enable the volume and automatically assign it the NCP name of CLUSTERVOLBOB, which is the assigned LVM name in all capital letters. Assign it the NCP volume ID of 240, which the administrator knows to be unique across all member nodes in the OES Cluster Services cluster and across all peer clusters in a Business Continuity Cluster.

This command automatically creates an LVM volume group cluster resource called clustervgbob_resource in a OES Cluster Services cluster where the node is a member. It creates its resource load, unload, and monitoring scripts; sets the resource to offline; and waits to be brought online by using the cluster commands. You manage the resource by using OES Cluster Services tools and commands.

6.6 Create Partition

create partition <type> <device> <size> [label] [dm]

Create a partition on a disk.

nlvm [nlvm_options] create partition <type> <device> <size> [label]
[dm]

The number of partitions per device can be limited by the device partitioning scheme, the partition type, or the device driver, whichever is the most restrictive.

- **Partitioning scheme:** The MS-DOS format allows up to 4 primary partitions, where 1 can be an extended partition with logical partitions. The GPT format allows up to 128 partitions.
- Partition type: If a device contains only Novell type partitions, the number of partitions is limited only by the space on the disk. If there are any non-Novell partitions on the device, each partition created, including Novell type partitions, will be a physical partition and limited by Linux to 255 partitions.
- **Device driver:** Check your device vendor's documentation to determine driver restrictions. For example, the Hewlett-Packard CCISS device driver supports up to 15 partitions per device, regardless of the partition type.

Best Practices for Creating Partitions

- Disks using Novell partitions should have only Novell partitions on the device.
- Do not create more than 15 partitions on a device.

Command Options

type=partition_type

Mandatory. You must specify the partition type in hexadecimal, without the leading 0x.

Before you create a OES Cluster Services SBD (split brain detector) partition with type=lad, you must take the cluster down, and stop OES Cluster Services from running on all nodes.

Examples

```
type=83 (partition type for Linux)
type=8e (partition type for Linux LVM)
type=169 (partition type for NSS)
type=1ad (partition type for OES Cluster Services SBD partition)
type=1ac (partition type for snapshots)
```

device=<devicename|anydisk|anyshared>

Mandatory. Specify the device to use for the partition, or specify the keyword anydisk or anyshared.

If you use NLVM to create an SBD, the nlvm create partition command can accept an initialized or uninitialized device when you use the type=lad option. NLVM checks the specified device to see if it is initialized, and takes the following actions:

- Uninitialized device: NLVM initializes the device, marks it as Shareable for Clustering, and creates the requested SBD partition.
- Initialized and shared device: NLVM creates the requested SBD partition.
- Initialized and unshared device: NLVM creates the requested SBD partition, but does not alter the shared state. It returns an error warning that the SBD partition is not shared.

You must manually mark the device as Shareable for Clustering after the partition is created. You can use the nlvm share command to share the device.

Examples

```
device=sdb
device=/dev/sdb
device=anydisk
device=anyshared
```

size=<value[K|M|G|T]|max>

Mandatory. Specify the size of the partition to create, or specify \max to use all free unpartitioned space. The minimum allowed size is 1 MB.

Because a physical partition must end on a cylinder boundary, its size might be slightly different than the size you specify. If the size does not fall naturally on a cylinder boundary, the partition size is rounded up or down, depending on the partition type, the size specified, and the amount of free space. For a Novell type partition (NSS or SBD), the size is rounded down. For a Linux type partition, the size is rounded up if enough free space is available; otherwise, the size is rounded down.

Examples

```
size=20G
size=100.45M
size=max
```

label="Label for the partition"

Specify the label to be added to a Novell partition type. This option is ignored for other partition types. If the label contains spaces, you must put quotation marks around it. If the label contains a special character, you must escape the character by adding a backslash character (\) in front of it.

If you create a OES Cluster Services SBD partition, the label should be the cluster name. For example, if the cluster name is cluster1, NLVM creates a partition named cluster1.sbd. If an SBD partition already exists for the cluster, the new partition is named cluster1.sbd1, and the cluster does not recognize it. To use the new partition for the cluster, you must delete the old partition. Then the new partition is automatically renamed as cluster1.sbd, and is used by the cluster.

Examples

```
label="This label has spaces"
label=engineering
label=special\/character
label=cluster1
```

dm

Create a device mapper object for this partition in the /dev/nss directory. This is useful when creating Novell partition types that need to be accessed directly.

Example

dm

Command Examples

nlvm create partition type=169 device=sdb size=20G dm

Create an NSS partition on the /dev/sdb device of size 20 GB. Also create a device mapper object for the partition, /dev/nss/sdb1.1.

nlvm create partition type=83 device=sdc size=200G

Create a Linux partition on the /dev/sdc device of size 200 GB.

nlvm create partition type=8e device=sdf size=200G

Create a Linux LVM partition on the /dev/sdf device of size 200 GB.

nlvm -s create partition type=1ad device=sdg size=max label=cluster1

Take the cluster down and stop OES Cluster Services. Create a OES Cluster Services SBD partition on the /dev/sdg device, and use all available free space on the device. Use the – s NLVM option to override the shared locking requirement and force the command to execute.

6.7 Create Pool

nlvm [nlvm_options] create pool <name> <size [device]|part> [ip] [vsn] [csn] [cifs] [type] [cachedev] [cachesize]

Create an NSS pool.

```
nlvm [nlvm_options] create pool <name> <size [device]|part> [ip] [vsn]
[csn] [cifs] [type][cachedev] [cachesize]
```

For a cluster-enabled pool, issue the command from the master node in the cluster.

NOTE: NSS64 pools are by default AD media upgraded. Creating NSS64 pools in a mixed-node cluster environment is not recommended, because the pools will not be accessible from nodes older than OES 2015. You can still go ahead and force the creation of the pool using the -f or -f or ce option. As a workaround, configure preferred nodes for each media-upgraded cluster resource so that these resources load on OES 2015 or later nodes.

Command Options

name=pool_name

Mandatory. Specify the name of the pool to create. This name must be unique from other pools. The pool name is automatically converted to uppercase.

Pool names are 2 to 15 characters. Uppercase letters A to Z, number characters 0 to 9, and underscore (_) are valid characters for all pools. Names cannot start or end in underscore, and cannot contain double underscores.

If the pool is not shared, the pool can also contain special characters:

!@#\$%&()

Names that contain special characters must be enclosed in quotation marks in all commands and scripts.

The names cannot be reserved names such as con, com, lpt, pipe, all, and so on.

Example

name=MYPOOL1

size=<value[K|M|G|T]|max>

Mandatory. Specify the amount of space to be used on the associated device. The size is not used if you specify the part= option instead of device=. The total pool size must be greater than 10 megabytes.

If multiple devices are specified, each device option instance must have a matching size option instance. The first size instance is matched to the first device instance, and so on.

Example

size=200G size=3.98T

device=<devicename|anydisk|anyshared>

Specify the device to use for the pool, or specify the keyword anydisk or anyshared.

Do not specify the device option in combination with the part option.

You can specify multiple device instances to create a pool comprised of multiple segments. Each device option instance must have a matching size option instance. The first device instance is matched to the first size instance, and so on. When specifying multiple devices, device names must be provided for each instance.

Examples

```
device=sdb
device=sde device=sdf device=sdg (Specify a size for each
instance.)
device=anydisk
device=anyshared
```

part=partition_name

Specify the node name (such as sdc1.1) for the partition where you want to create the pool. The partition must exist; it is not created with this command. The entire partition is used for the pool.

Do not specify the part option in combination with the device option.

Example

part=sdc1.1

ip=*ip_address*

Specify this option to create a cluster enabled pool. If using this option, the device or partition must be shared. This option is mandatory if you are creating a cluster enabled pool.

Example

ip=10.10.10.41

vsn=virtual_server_name

Specify the virtual server name for a cluster enabled pool. It is optional and used only for cluster enabled pools. If a name is not supplied, the default name will be used in the format of <clusterName>-<pcolName>-SERVER. Underscores in the cluster name or pool name are changed to hyphens. If you customize the virtual server name, you can use letters, numbers, hyphens, and underscores.

Examples

vsn=CLUS1-POOL-1-SERVER vsn=C1-P1-SERVER

csn=cifs_virtual_server_name

Specify the CIFS virtual server name for a cluster enabled pool. It is optional and used for cluster enabled pools where CIFS is enabled as an advertising protocol. The name can be up to 15 characters, which is a restriction of the CIFS protocol.

For users to collaborate effectively, all paths for user access should be identical, independent of the access protocol used. This is possible only if the same name is used for the NCP virtual server name and the CIFS virtual server name, and the name can be only up to 15 characters.

If the cifs option is used without the csn option, the NCP virtual server name is used as the CIFS virtual server name. In this case, if the name is more than 15 characters, the CIFS virtual server name uses the rightmost 13 characters and adds -W. For example, an NCP virtual server name of CLUSTER1-P-USERS is modified to STER1-P-USERS-W for the CIFS virtual server name. If a default NCP virtual server name was used in the form of <clusterName>-<poolName>-SERVER and the name exceeds 15 characters, the CIFS virtual server name uses the rightmost 13 characters of the <clusterName>-<poolName>-SERVER and the name exceeds 15 characters, the CIFS virtual server name uses the rightmost 13 characters of the <clusterName>-<poolName>-SERVER is modified to CLUS1-P123-W for the CIFS virtual server name.

To use the NCP virtual server name for the CIFS server name, use the <code>nlvm</code> command as follows without the csn option:

nlvm create pool name=a4 size=15M device=sdb ip=10.10.10.39 vsn=pqr cifs

In this example, ${\tt pqr}$ is used as the NCP virtual server name and CIFS virtual server name.

Examples

```
csn=CLUS1-P1
csn=c1-p123
```

cifs

Specify this option to enable CIFS as an advertising protocol when you create a cluster enabled pool. By default, CIFS is disabled as an advertising protocol. Novell CIFS must be installed on the machine in order for this option to work.

You can use the csn option to specify a CIFS virtual server name. Without the csn option, the NCP virtual server name is used as the CIFS virtual server name. See the csn option for details.

Example

cifs

type=[NSS64/NSS32]

Beginning with OES 2015, NSS supports two types of pools: NSS64 and NSS32. NSS32 pools use 32-bit block addressing and supports up to 8 TB, whereas, NSS64 pools use 64-bit block addressing and supports up to 8 EB (exabyte). When creating a pool, specify the pool type. If you do not specify the type, the default type is NSS32. All pools prior to OES 2015 use 32-bit block addressing and they are of type NSS32. You cannot change the pool type later.

NOTE: NSS64 pools are by default AD media upgraded. Creating NSS64 pools in a mixednode cluster environment is not recommended, because the pools will not be accessible from nodes older than OES 2015. You can still go ahead and force the creation of the pool using the -f or --force options. As a workaround, configure preferred nodes for each media-upgraded cluster resource so that these resources load on OES 2015 or later nodes.

Example

type=NSS64

cachedev_name

Optional. Specify the name of the NSS cache device to be expanded. This must be the first command option.

Example

cachedev=MYCACHEDEV1

cachesize=<value[K|M|G|T]|max>

Optional. Specify the amount of space to be used on the associated device. The total pool size must be greater than 10 megabytes.

If the size of the cache device is not mentioned then $1/10^{\text{th}}$ of pool size is allocated for the cache.

By default, an additional 1/4th of the cache size is allocated to cache metadata.

Example

```
cachesize=200G
cachesize=3.98T
```

Command Examples

nlvm create pool name=MYPOOL1 size=20G device=sdb

Create a pool named MYPOOL1 on device /dev/sdb that is 20 GB in size.

nlvm create pool name=MYPOOL2 size=20G device=sdb size=100GB device=sdg

Create a pool named MYPOOL2 that is a total of 120 GB in size. Use 20 GB of free space from device /dev/sdb. Use 100 GB of free space from device /dev/sdg.

nlvm create pool name=MYPOOL2 size=200G device=anydisk

Create a pool named MYPOOL2 on any device that has 200 GB of free unpartitioned space available.

nlvm create pool name=MYPOOL3 size=100G device=anyshared ip=<ip address>

Create a pool named MYPOOL3 on any shared device that has 100 GB of free unpartitioned space available.

nlvm create pool name=MYPOOL4 part=sdc1.1

Create a pool named MYPOOL4 on partition /dev/sdc1.1 and use all of the partition.

nlvm create pool name=MYPOOL5 part=sdc1.2 type=NSS64

Create a pool named MYPOOL5 of type NSS64 on partition $/{\tt dev/sdc1.2}$ and use all of the partition.

nlvm -f create pool name=MYPOOL6 size=100G device=sdc type=NSS64 ip=192.168.1.1

Forcefully creates the NSS64 pool named MYPOOL6 in a mixed-node cluster environment.

nlvm create pool name=MYPOOL1 size=20G device=sdb cachedev=MYCACHEDEV1 cachesize=3G

Create a pool named MYPOOL1 on device /dev/sdb that is 20 GB in size with cache association of 3 GB from cache device named MYCACHEDEV1.

6.8 Create RAID

create raid <name> <raid> [type] <size> <device> [stripe] [part]

Create an NSS software RAID device or an SBD software RAID device.

```
nlvm [nlvm_options] create raid <name> <raid> [type] <size> <device>
[stripe] [part]
```

Command Options

name=raid_name

Mandatory except when you mirror an existing SBD partition. This name must be unique from other RAID devices. The RAID name is case sensitive.

When you create an NSS software RAID device, you must specify the name of the device to create.

When you create a new OES Cluster Services SBD RAID 1 device, you must specify the name of the device to create. The name must match the name of an existing cluster (such as cluster1) that has a Cluster object in NetIQ eDirectory. This allows the SBD to be used by the cluster. The name is case sensitive.

When you mirror an existing OES Cluster Services SBD partition, the name is optional. If you specify a name (which should be the cluster name), the RAID 1 is given that name. If the name is not specified, the RAID 1 name defaults to the SBD partition's name.

RAID names are 2 to 58 characters. Names are preferred to use characters A to Z, a to z, 0 to 9, and underscore (_). Names cannot start or end in underscore, and cannot contain double underscores. Printable ASCII characters (see decimal codes 33 to 122 in a code chart) are valid.

RAID names can also contain the following special characters:

!@#\$%&()

Names that contain special characters must be enclosed in quotation marks in all commands and scripts. On the BASH command line, each special character must be escaped by preceding it with a backslash character (\).

The names cannot be reserved names such as con, com, lpt, pipe, all, and so on.

Example

name=MYRAID1

raid=<0|1|5>

Mandatory. Specify the RAID type. Valid options are 0 for striping, 1 for mirrored, or 5 for striping with parity.

Example

raid=1

type=<nss|sbd>

Mandatory except when you mirror an existing partition. Specify the type of partition to mirror. This option is used only for RAID 1. Valid options are nss and sbd (OES Cluster Services split-brain detector). The default mirror type is nss.

Before you create a new SBD RAID 1, you must take the cluster down, and stop OES Cluster Services from running on all nodes. This is not necessary when you mirror an existing SBD partition.

Examples

type=nss type=sbd

size=<value[K|M|G|T]|max>

Mandatory except when you mirror an existing partition. Specify the size of each segment of the RAID. The minimum size is 12 megabytes.

Because a physical partition must end on a cylinder boundary, its size might be slightly smaller than the size you specify. If the size does not fall naturally on a cylinder boundary, the partition size is rounded down for Novell type partitions.

Examples

size=20G size=1.45T

device=devicename

Mandatory. Specify the device to create a RAID segment on. This option is used multiple times, once for each segment to create. RAID 0 or RAID 1 requires a minimum of two devices. RAID 5 requires a minimum of three devices. Devices must be unique for each instance.

Example

device=sdb device=sdc device=sdd

stripe=stripe_size

Specify the RAID stripe size in bytes. This option is applicable only for RAID 0 and RAID 5. The stripe size must be a power of 2, with a minimum size of 4 KB and a maximum size of 256 KB. The default stripe size is 64 KB.

Example

stripe=64K

part=partition_name

Specify the node name for the partition to be mirrored. Use this option to mirror an existing NSS partition (such as sdc1.1) or OES Cluster Services SBD partition (such as cluster1.sbd). The existing partition is the first segment of a RAID 1 mirror.

If the part option is used, the RAID size option is ignored. Each segment's size is the size of the existing partition. The data on the original partition is mirrored on up to three specified devices.

After you mirror the partition, you manage the RAID 1 device by using the normal NSS software RAID management tools and commands.

Examples

```
part=sdc1.1
part=cluster1.sbd
```

Command Examples

nlvm create raid name=MYRAID5 size=20G raid=5 device=sdb device=sdc device=sdd

Create a RAID 5 (striping with parity) device that has segments of 20 GB each on devices / dev/sdb, /dev/sdc, and /dev/sdd. The default stripe size of 64 KB is automatically applied. The default partition type is nss.

nlvm create raid name=MYRAID1 raid=1 device=sdf part=sdc1.1

Create a RAID 1 (mirror) for the existing NSS pool partition /dev/sdcl.l on the /dev/sdf device. The partition type is the same as the existing partition's type. The pool's existing partition becomes the first segment of the RAID, and its existing data is mirrored to device /dev/sdf.

nlvm -s create raid name=cluster1 raid=1 type=sbd device=sdc size=max device=sde

Before you issue the command, take the cluster down, and then stop OES Cluster Services on all nodes. Create a new OES Cluster Services SBD RAID 1 device for a cluster named cluster1. Use devices sdc and sde. Use the maximum space available as the partition

size, based on the smaller of the two devices. Specify the size only once. Use the -s NLVM option to override the shared locking requirement and force the command to execute. Afterwards, join the nodes to the cluster.

nlvm create raid name=cluster2 raid=1 part=cluster2.sbd device=sdf

Mirror an existing OES Cluster Services SBD partition named cluster2.sbd. The RAID type is RAID 1. The name cluster2 is the same name as the cluster that uses the SBD partition. This name is also the same as the label on the existing SBD partition. The partition is mirrored on the previously initialized and shared device /dev/sdf. Device sdf is at least the size of the existing partition, and can be formatted as MSDOS or GPT. The new SBD RAID 1 device is named cluster2.sbd. The mirrored SBD partitions are named cluster2.msbd0 and cluster2.msbd1.

6.9 Create Snap

create snap <name> <pool> <<device> <size> |<part>> [chunk]

Create a snapshot of an NSS pool.

nlvm [nlvm_options] create snap <name> <pool> <<device> <size> |<part>>
[chunk]

For the stored-on location, you can specify the device and size, or specify an existing snap partition (type 1AC).

Command Options

name=snapshot_name

Mandatory. Specify the name of the NSS snapshot. This name must be a unique snap name on the server. The snap name is automatically converted to uppercase.

Pool snapshot names are 2 to 15 characters. The naming conventions are the same as for pools.

Example

name=POOL1SNAP

pool=pool_name

Mandatory. Specify the name of an existing pool that you want to snap.

Example

pool=MYPOOL1

device=devicename

Specify the device where you want to store the copy-on-write data for this snapshot. Use the size option to specify the amount of space to use on the device.

The device and size options are used instead of the part option.

Example

device=sdb

size=<value[K|M|G|T]|max>

Specify the amount of space to use on the specified device. The minimum size is 50 MB; there is no maximum. A snap partition (type 1AC) of the specified size is created on the specified device.

NSSMU restricts the maximum snapshot size to 8 TB.

Examples

size=20G size=100.50M

part=<snap_partition>

Specify an existing, but currently unused, snap partition (type 1AC) where you want to store the copy-on-write data for this snapshot. Because the partition will be re-initialized and associated with this snapshot, it must not belong to any current snapshot. A snap partition can be used by only one snapshot.

Only a partition of type 1AC (snapshot) is allowed; all other partition types result in an error.

The part option is used instead of the device and size options.

Example

part=sdd3

chunk=chunk_size

Specify the chunk size of the snapshot in bytes. The default size is 64 KB. The chunk size must be a power of 2, with the minimum size of 512 bytes, and a maximum size of 256 KB.

Example

chunk=128K

Command Example

nlvm create snap name=POOL1SNAP pool=MYPOOL1 device=sdb size=20G chunk=128K

Create a snapshot named POOL1SNAP of pool MYPOOL1. The copy-on-write partition is on device /dev/sdb and of size 20 GB, and the snapshot chunk size is 128 KB.

nlvm create snap name=POOL2SNAP pool=MYPOOL2 part=sdd3 chunk=128K

Create a snapshot named POOL2SNAP of pool MYPOOL2. The copy-on-write partition uses an existing but unused partition /dev/sdd3 of type 1AC (snapshot), and the snapshot chunk size is 128 KB. The specified partition is re-initialized and assigned to snap POOL2SNAP.

6.10 Create Volume

create volume <name> <pool> [passw] [keytype] [quota] [volid] [adenable]

Create an NSS volume on an existing pool. NSS volumes are always mounted at /media/nss/ <VolumeName> unless otherwise specified.

```
nlvm [nlvm_options] create volume <name> <pool> [passw] [keytype]
[quota] [volid] [adenable]
```

Command Options

name=volume_name

Mandatory. Specify the name of the NSS volume to create. This name must be unique from other volumes. The volume name is automatically converted to uppercase.

Volume names are 2 to 15 characters. The naming conventions are the same as for pools.

Example

name=MYVOL1

pool=pool_name

Mandatory. Specify the name of an existing NSS pool where you want to create the volume.

Example

pool=MYPOOL1

passw=password

Specify a password if the volume is an encrypted volume.

Example

passw=novell

keytype=<AES128/AES256>

Optional. Specify a keytype value along with the password if the volume is an encrypted volume. If the keytype option is not used, AES128 encryption algorithm is used by default on the encrypted volume. Valid options are AES128 and AES256. This option should be used only with the passw option.

The AES256 value should be used only on the NSS64 pool type with the pool media upgraded to AES.

Example

keytype=AES256

quota=size

Optional. Specify a quota for the volume. A quota is the maximum amount of space in the pool that can be used by the volume. If no quota is specified or if the quota value exceeds the size of the pool, the volume can grow to the size of the pool.

If the maximum pool size is smaller than the specified volume quota, the volume can grow only to the size of the pool. If you later expand the size of the pool, then the volume quota is again the limiting factor.

Example

quota=500G

volid=value

(Optional) Used in combination with a clustered NSS pool to assign an NCP volume ID for a clustered NSS volume. If the volid option is not used, a volume ID is automatically assigned. For clustered volumes, the valid range is 254 to 0, in descending order.

In a Cluster Services cluster, the volume ID must be unique across all member nodes. In a Business Continuity Cluster, the volume ID must be unique across all nodes in every peer cluster.

Example

pool=MYPOOL50 volid=250

MYPOOL50 is a clustered NSS pool.

adenable=yes

(Optional) To create a volume with AD enabled, enter the value as 'yes'.

Example

adenable=yes

Command Examples

nlvm create volume name=MYVOL1 pool=MYPOOL1

Create a non-encrypted NSS volume on an existing pool named MYPOOL1.

nlvm create volume name=MYVOL1 pool=MYPOOL1 passw=novel1 keytype=AES256

Create an NSS volume on an existing pool named MYPOOL1, and encrypt the volume using the AES256 encryption algorithm and password as novel1.

nlvm create volume name=MYVOL1 pool=MYPOOL1 quota=500G

Create a non-encrypted NSS volume on an existing pool named MYPOOL1. The volume has a quota of 500 GB.

nlvm create volume name=MYVOL50 pool=MYPOOL50 volid=250

Create a non-encrypted, clustered NSS volume on an existing clustered NSS pool named MYPOOL50. Assign it the NCP volume ID of 250, which the administrator knows to be unique across all member nodes in the OES Cluster Services cluster and across all peer clusters in a Business Continuity Cluster.

nlvm create volume name=MYVOL1 pool=MYPOOL1 adenable=yes

Create a non-encrypted NSS volume on an existing NSS pool named MYPOOL1 with AD media enabled.

6.11 Create Cachedev

create cachedev <name> <size> <device>

Create an NSS cachedev.

nlvm [nlvm_options] create cachedev <name> <size> <device>

Command Options

name=cachdev_name

Mandatory. Specify the name of the cache device to create. This name must be unique from other cache devices. The cache device name is automatically converted to uppercase.

Cache device names are 2 to 15 characters. Uppercase letters A to Z, number characters 0 to 9, and underscore (_) are valid characters for all cache devices. Names cannot start or end in underscore, and cannot contain double underscores.

If the cache device is not shared, the cache device can also contain special characters:

!@#\$%&()

Names that contain special characters must be enclosed in quotation marks in all commands and scripts.

Example

name=MYCACHEDEV1

size=<value[K|M|G|T]|max>

Mandatory. Specify the amount of space to be used on the associated device. The size is not used if you specify the part= option instead of device=. The total cache device size must be greater than 10 megabytes.

If multiple devices are specified, each device option instance must have a matching size option instance. The first size instance is matched to the first device instance, and so on.

Example

size=200G size=3.98T

device=<devicename>

Specify the device to use for the cache device.

Do not specify the device option in combination with the part option.

You can specify multiple device instances to create a cache device comprised of multiple segments. Each device option instance must have a matching size option instance. The first device instance is matched to the first size instance, and so on. When specifying multiple devices, device names must be provided for each instance.

Examples

```
device=sdb
device=sde device=sdf device=sdg (Specify a size for each
instance.)
```

Command Examples

nlvm create cachedev name=MYCACHEDEV1 device=sdd size=10G device=sde size=15G

Create a cachedev named $\tt MYCACHEDEV1$ from device $\tt sdd$ and sde that has size of 10 GB and 15 GB respectively.

6.12 Pool Cacheenable

pool cacheenable <name> <device> <size>

Associate a cache with an existing pool.

```
nlvm [nlvm_options] cacheenable <name> <cachedev> <cachesize>
```

Command Options

name=pool_name

Mandatory. Specify the name of an existing pool for which you want to associate a cache.

Example

name=MYPOOL1

cachedev=cachedev_name

Mandatory. Specify the name of the NSS cache device from which the cache has to be allocated.

Examples

```
cachedev=MYCACHEDEV1
```

cachesize=<value[K|M|G|T]|max>

Mandatory. Specify the amount of space to be used on the associated device. The size is not used if you specify the part= option instead of device=. The total cache device size must be greater than 10 megabytes.

If multiple devices are specified, each device option instance must have a matching size option instance. The first size instance is matched to the first device instance, and so on.

Example

size=200G size=3.98T

Command Examples

nlvm pool cacheenable name=MYPOOL1 cachedev=MYCACHEDEV1 cachesize=2G Associate cache size of 2G from MYCACHEDEV1 to an existing pool MYPOOL1. By default, an additional 1/4th of the cache size is allocated to cache metadata.

6.13 Pool Cachedisable

pool cachedisable <name>

Disable the associated cache from a pool.

nlvm [nlvm_options] pool cachedisable <name>

Command Options

name=pool_name

Mandatory. Specify the name of a pool from which you want to disable the cache. **Example**

name=MYPOOL1

Command Examples

nlvm pool cachedisable name=MYPOOL1

Disable the associated cache that was associated during the creation or post-creation of MYPOOL1.

6.14 Pool Cachesync

pool cachesync <name>

Causes all pending modifications to the pool's metadata and cached file data to be written to the underlying storage pool.

nlvm [nlvm_options] pool cachesync <name>

Command Options

name=pool_name

Mandatory. Specify the name of a cache enabled pool.

Example

name=MYPOOL1

Command Examples

nlvm pool cachesync name=MYPOOL1

Causes all pending modifications to the pool's metadata and cached file data to be written to the MYPOOL1.

6.15 Delete Linux Volume

delete linux volume <volume_name>

Delete an existing Linux POSIX volume. You cannot delete the root (/) volume. You must unmount the volume before you can delete it.

If the volume is a clustered LVM volume group and logical volume, you must take the cluster resource offline, and then delete the resource before you can delete the volume.

nlvm [nlvm_options] delete linux volume <volume_name>

You are automatically prompted to confirm the delete action. Respond by typing yes or no, then press Enter. Use the --no-prompt NLVM option to suppress the confirmation prompt.

You can use the nlvm list linux volumes command to find the volume_name. A Linux POSIX volume is preceded by a forward slash, such as /vol1. This is the last directory of the mount point path that you provided when you created the Linux POSIX volume with NLVM or NSSMU. An LVM volume name is the volume name you used when you created the volume, such as lvvol1.

Command Options

volume_name

Mandatory. Specify the name of the volume to delete.

Examples

For a Linux POSIX volume mounted at /home/bob, the volume name is /bob.

For an LVM logical volume that you named lvvol1 that is mounted at /mnt/lvvol1, the volume name is lvvol1 (with no forward slash).

For an LVM logical volume that you named lvvol2 that is mounted at /home/users, the volume name is lvvol2 (not /users).

--no-prompt

Optional. Specify this NLVM option to prevent a confirmation message from being displayed.

Example

--no-prompt

Command Examples

nlvm delete linux volume /bob

Delete the Linux POSIX volume that is mounted at /home/bob.

nlvm delete linux volume lvvol1

Delete the Linux LVM logical volume lvvol1 that is mounted at /mnt/lvvol1.

nlvm --no-prompt delete linux volume lvvol2

Delete the Linux LVM logical volume lvvol2 that is mounted at /home/users. The confirmation message is not displayed.

6.16 Delete Move

delete move <<move_name>|< pool_name>>

Delete an NSS pool move. This command deletes the move request, returns the pool back to its original location, and removes the new location. You can delete the move at any time while the move is in progress, even if it is pending only the complete move command to be finalized.

Use the ${\tt complete}\ {\tt move}\ {\tt command}\ {\tt if}\ {\tt you}\ {\tt want}\ {\tt to}\ {\tt keep}\ {\tt the}\ {\tt new}\ {\tt location}\ {\tt and}\ {\tt remove}\ {\tt the}\ {\tt original}\ {\tt location}.$

If a pool is cluster-enabled, issue the command on the node where its pool cluster resource is currently online.

nlvm [nlvm_options] delete move <<move_name>|<pool_name>>

You are automatically prompted to confirm the delete action. Respond by typing yes or no, then press Enter. Use the --no-prompt NLVM option to suppress the confirmation prompt.

Command Options

move_name or pool_name

Mandatory. Specify the name of the NSS pool move to delete, such as POOLNAME_move. You can alternatively specify the pool name.

--no-prompt

Optional. Specify this NLVM option to prevent a confirmation message from being displayed.

Example

--no-prompt

Command Example

nlvm delete move MYPOOL_move

Delete the pool move named MYPOOL_move. This removes the new location, and sets the pool to the original location.

6.17 Delete Partition

delete partition <partition_name>

Delete an existing partition by name.

nlvm [nlvm_options] delete partition <partition_name>

You are automatically prompted to confirm the delete action. Respond by typing yes or no, then press Enter. Use the --no-prompt NLVM option to suppress the confirmation prompt.

Before you create a OES Cluster Services SBD partition, you must take the cluster down, and stop OES Cluster Services from running on all nodes.

Command Options

partition_name

Mandatory. Specify the node name (such as sdc1.1) of the partition to be deleted.

Example

sdc1.1

-f, --force

Optional. The force NLVM option can be used with the delete partition command if the partition is part of a pool or move. If the partition is part of a pool, deleting the partition automatically deletes the pool. If the partition is part of a move destination, deleting the partition automatically deletes the pool move.

Examples

-f --force

--no-prompt

Optional. Specify this NLVM option to prevent a confirmation message from being displayed.

Example

--no-prompt

Command Examples

nlvm delete partition sdc1.1

Delete the partition /dev/sdc1.1.

nlvm --force delete partition sdd1.2

Delete the partition /dev/sdd1.2 that is part of an NSS pool move destination. The pool move is deleted as well.

6.18 Delete Pool

delete pool <pool_name>

Delete an existing NSS pool by name.

nlvm [nlvm_options] delete pool <pool_name>

You are automatically prompted to confirm the delete action. Respond by typing yes or no, then press Enter. Use the --no-prompt NLVM option to suppress the confirmation prompt.

Command Options

pool_name

Mandatory. Specify the name of the NSS pool to be deleted.

Example

MYPOOL1

--no-prompt

Optional. Specify this NLVM option to prevent a confirmation message from being displayed.

Example

--no-prompt

Command Example

nlvm delete pool MYPOOL1

Delete the NSS pool named MYPOOL1. If MYPOOL1 is a cache-enabled pool then the associated cache will also be deleted.

6.19 Delete Cachedev

delete cachedev <cachedev_name>

Delete an existing NSS cache device.

nlvm [nlvm_options] delete cachedev <cachedev_name>

You are automatically prompted to confirm the delete action. Respond by typing yes or no, then pressing Enter. Use the --no-prompt NLVM option to suppress the confirmation.

Command Options

cachedev_name

Mandatory. Specify the name of the NSS cache device to be deleted.

Example

MYCACHEDEV1

--no-prompt

Optional. Specify this NLVM option to prevent a confirmation message from being displayed.

Example

--no-prompt

Command Example

nlvm delete cachedev MYCACHEDEV1

Delete the NSS cache device named MYCACHEDEV1.

6.20 Delete RAID

delete raid <raid_name>

Delete an existing NSS software RAID device by name.

If the RAID device is a single element RAID 1, this command removes the RAID 1 mirror object from the pool partition and leaves the pool on the corresponding partition. The pool is not deleted and no data is destroyed.

When you delete a single element RAID1 mirror for an SBD (split-brain detector) partition, it removes the mirror object and leaves the SBD in the corresponding partition. The SBD is not deleted and no data is destroyed.

For a RAID1 that contains multiple elements, deleting the RAID1 deletes all mirrors and the pool partitions or SBD partitions on them. All data is destroyed. If you want to keep the pool or SBD on one of the member devices, use the nlvm delete partition command to delete the partitions for mirror elements you do not want to keep. For the remaining single-element mirror, go to the RAIDs page and delete the RAID1 mirror element. This removes the RAID1 object and leaves the pool partition or SBD partition.

nlvm [nlvm_options] delete raid <raid_name>

You are automatically prompted to confirm the delete action. Respond by typing yes or no, then press Enter. Use the --no-prompt NLVM option to suppress the confirmation prompt.

For single element RAID 1 devices, this command duplicates the nlvm raid delete command, which deletes a single element mirror from a pool, leaving the pool on the corresponding partition.

Before you delete a OES Cluster Services SBD RAID 1, you must take the cluster down, and stop OES Cluster Services from running on all nodes.

Command Options

raid_name

Mandatory. Specify the name of the NSS software RAID device to be deleted.

Example

MYRAID1

--no-prompt

Optional. Specify this NLVM option to prevent a confirmation message from being displayed.

Example

--no-prompt

Command Example

nlvm delete raid MYRAID1

Delete the NSS software RAID device named MYRAID1.

6.21 Delete RAID Segment

delete raid <raid_name> segment <number>

Delete a specified segment of an existing NSS software RAID device. This is valid only for RAID 1 and RAID 5 devices. RAID 5 can remove only 1 segment, but it must be replaced by another segment in order to have redundancy.

nlvm [nlvm_options] delete raid <raid_name> segment <number>

You are automatically prompted to confirm the delete action. Respond by typing yes or no, then press Enter. Use the --no-prompt NLVM option to suppress the confirmation prompt.

Use the --force NLVM option to remove out-of-sync segments.

Command Options

raid_name

Mandatory. Specify the name of the NSS software RAID device that contains the segment to be deleted.

Example

MYRAID1

number

Mandatory. Specify the segment index (zero relative) to be removed. For RAID 1, the value must be 0 to 3. For RAID 5, the value must be 0 to 13.

Example

0

--no-prompt

Optional. Specify this NLVM option to prevent a confirmation message from being displayed.

Example

--no-prompt

-f, --force

Optional. Specify this NLVM option to force the command to delete out-of-sync segments.

Command Example

nlvm delete raid MYPOOL1 segment 0

Delete the first segment of the NSS software RAID device named MYRAID1.

nlvm --force delete raid MYPOOL1 segment 1

Delete the second segment of the NSS software RAID device named MYRAID1. Use the -- force option to force the deletion of an out-of-sync segment.

6.22 Delete Snap

delete snap <snap_name>

Delete an existing NSS pool snapshot by name.

nlvm [nlvm_options] delete snap <snap_name>

You are automatically prompted to confirm the delete action. Respond by typing yes or no, then press Enter. Use the --no-prompt NLVM option to suppress the confirmation prompt.

Command Options

snap_name

Mandatory. Specify the name of the NSS pool snapshot to be deleted.

Example

POOL1SNAP

--no-prompt

Optional. Specify this NLVM option to prevent a confirmation message from being displayed.

Example

--no-prompt

Command Example

nlvm delete snap POOL1SNAP

Delete the NSS pool snapshot named POOL1SNAP.

6.23 Delete Volume

delete volume <volume_name>

Delete an existing NSS volume by name.

nlvm [nlvm_options] delete volume <volume_name>

You are automatically prompted to confirm the delete action. Respond by typing yes or no, then press Enter. Use the --no-prompt NLVM option to suppress the confirmation prompt.

Command Options

volume_name

Mandatory. Specify the name of the NSS volume to be deleted.

Example

MYVOL1

--no-prompt

Optional. Specify this NLVM option to prevent a confirmation message from being displayed.

Example

--no-prompt

Command Example

nlvm delete volume MYVOL1

Delete the NSS volume named MYVOL1.

6.24 Expand Partition

expand partition <partition_name> <size>

Expand an existing partition.

This command does not add a partition, but expands the existing partition. There must be free space contiguously following this partition in order to expand it.

nlvm [nlvm_options] expand partition <partition_name> <size>

Command Options

partition_name

Mandatory. Specify the node name (such as sdc1.1) of the partition to be expanded. This must be the first command option.

Example

sdc1.1

size=<value[K|M|G|T]|max>

Mandatory. Specify the amount of space to add to the existing partition.

Examples

size=20G size=200.45G

Command Example

nlvm expand partition sdc1.1 size=20G

Expand the /dev/sdc1.1 partition by adding the next 20 GB of contiguous free unpartitioned space. For example, if the original partition is 20 GB, the expanded size is 40 GB.

6.25 Expand Pool

expand pool cool_name <size device | part >

Expand an existing NSS pool by adding a new partition. Either a partition must be specified, or the device and size must be specified.

If the specified device is the same device as the last segment of the existing pool, and free space exists following the last segment, the utility tries to expand the partition first before trying to add a new partition.

nlvm [nlvm_options] expand pool pool_name> <size device | part >

Command Options

pool_name

Mandatory. Specify the name of the NSS pool to be expanded. This must be the first command option.

Example

MYPOOL1

device=device_name

Specify the device to use for the expanded space.

You can specify multiple device option instances to create a pool comprised of multiple segments. Each device option instance must have a matching size option instance. The first device instance is matched to the first size instance, and so on.

Example

device=sdb

size=<value[K|M|G|T]|max>

Specify the amount of space to add to the existing pool.

If multiple devices are specified, each device option instance must have a matching size option instance. The first size instance is matched to the first device instance, and so on.

Examples

size=20G size=100.50M

part=partition_name

Specify the name of a partition to add to the pool. The entire partition size is added to the pool's capacity. The partition must be of type 0X169 (nss).

Example

part=sdc1.1

Command Examples

nlvm expand pool MYPOOL1 device=sdf size=20G

Expand the NSS pool named MYPOOL1 by adding the 20 GB of free space from device / dev/sdf.

nlvm expand pool MYPOOL2 device=sdf size=20G device=sdg size=100G

Expand the NSS pool named MYPOOL1 by adding the 20 GB of free space from device / dev/sdf and 100 GB of free space from device /dev/sdg.

nlvm expand pool MYPOOL1 part=sdc1.1

Expand the NSS pool named MYPOOL1 by adding the /dev/sdcl.1 partition to it. The partition is type 0X169. The entire partition size is added to the pool's capacity.

6.26 Expand Cachedev

expand cachedev <cachedev_name> <device> <size>

Expand an existing NSS cache device by specifying the device and size details.

nlvm [nlvm_options] expand cachdev <cachdev_name> <device> <size>

Command Options

cachedev_name

Mandatory. Specify the name of the NSS cache device to be expanded. This must be the first command option.

Example

MYCACHEDEV1

device=device_name

Specify the device to use for the expanded space.

You can specify multiple device option instances to expand a cache device. Each device option instance must have a matching size option instance. The first device instance is matched to the first size instance, and so on.

Example

device=sdb

size=<value[K|M|G|T]|max>

Specify the amount of space to add to the existing cache device.

If multiple devices are specified, each device option instance must have a matching size option instance. The first size instance is matched to the first device instance, and so on.

Example

size=20G size=100.50M

Command Examples

nlvm expand cachedev MYCACHEDEV1 device=sdf size=20G

Expand the NSS cache device named MYCACHEDEV1 by adding the 20 GB of free space from device /dev/sdf.

nlvm expand cachedev MYCACHEDEV2 device=sdf size=20G device=sdg size=100G

Expand the NSS cache device named MYCACHEDEV1 by adding the 20 GB of free space from device /dev/sdf and 100 GB of free space from device /dev/sdg.

6.27 Expand RAID

expand raid <raid_name> <device>

Expand an existing NSS software RAID device by adding a new segment. Specify the RAID name and the device to use. The device option can be specified multiple times to specify additional segments. Each device must have a free space area at least as big as the segment size of the RAID.

```
nlvm [nlvm_options] expand raid <raid_name> <device>
```

Command Options

raid_name

Mandatory. Specify the name of the NSS software RAID device to be expanded. This must be the first command option.

Example

MYRAID1

device=device_name

Specify the device to use for the expanded space.

Example

device=sdb

Command Examples

nlvm expand raid MYRAID1 device=sdf

Expand the NSS software RAID device named MYRAID1 by adding the device /dev/sdf.

nlvm expand raid MYRAID5 device=sdg device=sdh

Expand the NSS software RAID device named MYRAID5 by adding the $/{\rm dev}/{\rm sdg}$ and $/{\rm dev}/{\rm sdh}$ devices as two new segments.

6.28 Fstrim Pool

fstrim pool <pool_name>

It is used on a mounted pool to discard (or trim) blocks which are not in use by the pool. You must use this option only on thin-provisioned storage devices.

nlvm [nlvm_options] fstrim pool <pool_name>

Command Option

pool_name

Mandatory. Specify the name of the NSS pool.

Example

MYPOOL1

Command Examples

nlvm fstrim pool MYPOOL1

Trims the unused blocks in the NSS pool named MYPOOL1 and then displays the trimmed size in bytes.

nlvm fstrim pool MYPOOL1 async

Trims the unused blocks in the NSS pool named MYPOOL1 asynchronously. For more information on the trimmed size in bytes, see logs at /var/log/messages.

6.29 Fstrim Status

fstrim status <pool_name>

Displays the fstrim state, last executed time, and last trimmed size on the specified pool.

nlvm [nlvm_options] fstrim status <pool_name>

Command Option

pool_name

Mandatory. Specify the name of the NSS pool.

Example

MYPOOL1

Command Example

nlvm fstrim status MYPOOL1

Displays the fstrim state, last executed time, and last trimmed size on the NSS pool named MYPOOL1.

6.30 Init Device

init <device_name> [format] [shared|unshared]

Initialize a device by deleting all partitions on the device and setting the partitioning scheme.

nlvm [nlvm_options] init <device_name> [format] [shared |unshared]

You are automatically prompted to confirm the initialize action. Respond by typing yes or no, then press Enter. Use the --no-prompt NLVM option to suppress the confirmation prompt.

You can optionally specify whether to set the device as shared or unshared. If neither the shared nor unshared option is added, the device is initialized, the partitioning scheme is set, and the shared state remains what it was before the initialize command.

Command Options

device_name

Mandatory. Specify the name of the device to be initialized. This must be the first command option.

You can enter multiple devices by separating the device names with a comma and no spaces.

Examples

sdb sde,sdf,sdg MYCACHEDEV1

format=<gpt|msdos>

Specify the partitioning scheme as gpt or msdos. The default is gpt. The MSDOS partitioning scheme supports device sizes that are less than or equal to 2 TB. If the device size is greater than 2 TB and the msdos partitioning scheme is specified, then the device size is truncated to 2 TB with the remainder as unusable space. Devices of any size can be set to use the GPT partitioning scheme.

Example

format=gpt

shared

After initializing the device, the device is set as shared. A small partition is created on the device to store the shared setting. The remainder of the device is free space.

For example, use this option to mark a device as Shareable for Clustering if you plan to use it for a shared NSS pool. NSS looks for this setting to cluster enable the pool.

unshared

After initializing the device, the device is not marked as shared. The device is unpartitioned free space.

Use this option to remove all partitions from a device. For example, LVM requires that a device contains no partitions before it creates a volume group on it.

-f, --force

Optional. Specify this NLVM option to force the initialization. This option is required if the device contains a root (/), swap, or boot partition, or if the init command cannot delete any pools on the disk.

This option is also required if the device is part of **cache-enabled** environment to force the initialization.

Examples

-f --force

--no-prompt

Optional. Specify this NLVM option to prevent a confirmation message from being displayed.

Example

--no-prompt

Command Examples

nlvm --force init sdb

Force the initialization of a previously formatted device /dev/sdb, and set its partitioning scheme to use the default setting of msdos. If the device size is greater than 2TB, the device has only 2 TB of usable space. If the device was previously set as shared, the shared setting remains after the initialization. Otherwise, the device is unshared.

nlvm init sdd format=gpt unshared

Initialize the device /dev/sdd, and set its partitioning scheme to GPT. If the device was previously set as shared, this removes the shared setting from the device. The device is unpartitioned free space.

nlvm init sde format=gpt shared

Initialize the device /dev/sde, set its partitioning scheme to GPT, and mark the device as shared. The device contains a small partition to hold the shared setting, and the rest is free space.

nlvm --no-prompt init sde,sdf,sdg format=gpt unshared

Initialize multiple devices at a time. Set each device's partitioning scheme to GPT. If a device was previously set as shared, the unshared option removes its shared setting. The devices are each unpartitioned free space. The confirmation message is not displayed.

6.31 Label

label <partition_name> <"label text">

Modify or add a label to a Novell type partition (NSS, SBD, or RAID).

nlvm [nlvm_options] label <partition_name> <"label text">

Command Options

partition_name

Mandatory. Specify the node name (such as sdc1.1) of the partition. This must be the first command option.

Example

sdc1.1

"label text"

Mandatory. Specify the text word or phrase to use for the label. If the text has spaces, use quotation marks.

Example

```
"This is the label" engineering
```

Command Example

nlvm label sdc1.1 "This is the label"

Add the label "This is the label" to the /dev/sdc1.1 partition.

6.32 Linux Mount

linux mount <lx_volume_name>

Mount a specified Linux POSIX volume on Linux. If the volume is NCP-enabled, this command also mounts the volume for NCP, and NCP assigns it a volume ID.

nlvm [nlvm_options] linux mount <lx_volume_name>

Command Options

lx_volume_name

Mandatory. Specify the name of the Linux POSIX volume to mount.

Use the name format as it is displayed in NSSMU or with the nlvm list volumes command. For a non-LVM volume that is not NCP-enabled, specify the name as a forward slash with the name of the final directory of the mount point (/<dir_name>). For an LVM volume that is not NCP-enabled, specify the volume name of the LVM logical volume. For an NCP-enabled volume, specify the NCP name in all capital letters. Volume names are case sensitive.

Examples

LV_VOL1	[ex: an LVM volume that is NCP-enabled]
lv_vol1	[ex: an LVM volume that is not NCP-enabled]
HOME	[ex: a non-LVM volume that is NCP-enabled]
/home	[ex: a non-LVM volume that is not NCP-
enabled]	

mntopt=<option1[,option2][,...]>

Specify the options to use when mounting the volume. For a list of available options, see the mount (8) man page. The default mntopt option is rw.

Example

mntopt=rw

Command Examples

nlvm linux mount LV_VOL1

Mounts the NCP-enabled LVM volume LV_VOL1 in Linux using the parameters from the / etc/fstab file, and then mounts it in NCP. NCP automatically assigns a volume ID.

nlvm linux mount /home

Mounts the non-LVM volume using the parameters from the /etc/fstab file.

nlvm linux mount HOME

Mounts the NCP-enabled non-LVM volume in Linux using the parameters from the /etc/fstab file, and then mounts it in NCP. NCP automatically assigns a volume ID.

nlvm linux mount HOME mntopt=rw,user_xattr

Mounts the NCP-enabled non-LVM volume in Linux using the specified mount parameters for an Ext3 file system type, and then mounts the volume in NCP. NCP automatically assigns a volume ID.

6.33 Linux Unmount

linux unmount </x_volume_name>

Dismount a specified Linux volume. If the volume is NCP-enabled, it also dismounts it from NCP before it dismounts it from Linux.

```
nlvm [nlvm_options] linux unmount <lx_volume_name>
```

Command Option

lx_volume_name

Mandatory. Specify the name of the Linux POSIX volume to dismount.

Use the name format as it is displayed in NSSMU or with the nlvm list volumes command. For information, see nlvm linux mount.

Examples

LV_VOL1	[ex: an LVM volume that is NCP-enabled]
lv_vol1	[ex: an LVM volume that is not NCP-enabled]
HOME	[ex: a non-LVM volume that is NCP-enabled]
/home	[ex: a non-LVM volume that is not NCP-
enabled]	

Command Example

nlvm volume unmount HOME

Dismounts the NCP-enabled non-LVM volume ${\tt HOME}$ from NCP, and then dismounts it from Linux.

nlvm volume unmount /home

Dismounts the non-LVM volume $\slash\slas$

```
nlvm volume unmount lv_vol1
```

Dismounts the LVM volume lv_vol1 from Linux.

6.34 List Device

list device <device_name>

Print the details of a specified device.

nlvm [nlvm_options] list device <device_name>

Command Option

device_name

Mandatory. Specify the desired device.

Example

sdb

Command Example

nlvm list device sdb

Print the details for the /dev/sdb device.

Response Parameters

The device details include the following values. Most labels are self-explanatory.

Label	Description						
Name	Device name such as sdb or raid1						
Size	Total amount of space on the device in KB, MB, GB, or TB, and the number of whole sectors in that space						
	Size=623.91MB (1277773)						
Used	Used space on the device in KB, MB, GB, or TB, and the number of whole sectors in that space.						
Free	Available space on the device in KB, MB, GB, or TB, and the number of whole sectors in that space						
Format	MSDOS, GPT, CSM (legacy EVMS Cluster Segment Manager), LVM (clustered Linux LVM volume), None (not initialized)						
Shared	Yes or No; whether this device is marked as Shareable for Clustering						
RAID	Yes or No; whether this is an NSS software RAID device						
M:M	Major:Minor numbers, such as 8:112						
H:S	Heads:Sectors geometry per track, such as 255:32						
SectorSize (logical/physical)	Logical or physical sector size of a device						
Provisioning	Thick or Thin provisioning type						
CACHE	Yes or No; whether this device is cachedev						

If the device contains partitions, it provides the following information:

abel Description						
Part	Partition name such as sdb1.1, sdc2, or cluster.sbd					
Partition=						
Туре	Partition type, including NSS, NSS RAID, SBD, NSS_Cache, Linux, Linux_swap, LVM					
Size	Amount of space allocated to the partition in KB, MB, GB, or TB					
Sectors	Number of whole sectors allocated to the partition					
Pool	If the partition is the NSS type, the name of the pool that resides on the partition (if any)					

For NSS software RAID devices, it provides the following information:

Label	Description
RAID	No or RAID type (0, 1, or 5)
Sync	Yes or %; whether the RAID is in sync or if a sync is in progress
Segs	Number of segments defined for the RAID
Enbl	Yes or No; whether the RAID is enabled on this node
Missing	Segment number (if any) that is missing in the RAID
Stripe	RAID stripe size in bytes (typically KB) for RAID types 0 and 5

For RAID segments, it provides the following information:

Label	Description
Segment	Segment index number
Name	Segment name, such as sdb1.4
Device	Name of the device that contains the segment, such as sdb
Size	Segment size in KB, MB, GB, or TB
Sectors	Number of whole sectors allocated to the partition

Sample Command Responses

Sample 1: Standard Device

```
nlvm list device sdf
Name=sdf
 Size=1.63TB(3515088896) Used=801.00GB(1679818816) Free=875.12GB(1835269816)

6.35 List Devices

list devices [exclude] [more | all]

Print a list of the devices. For each device, display the device name, size, free available space, partitioning type, if it is marked as Shareable for Clustering, and if it is an NSS software RAID device. If no other options are specified, this prints a list of all devices and software RAID devices.

nlvm [-t] list devices [exclude] [more all]

Command Options

exclude=<raid|nonraid|shared|nonshared|lvm|nonlvm>

Exclude the specified type of devices. This option can be used multiple times to add exclusions for different types. Valid device types are raid, nonraid, shared, nonshared, lvm, or nonlvm.

Example

exclude=raid exclude=nonshared

-t, --terse

Use this NLVM option to format the output for parsing.

more

Prints more information than appears in the standard output. It can be used with or without the -t NLVM option.

Example

more

all

Prints detailed information about each of the devices. This is the same information that is printed for the nlvm list device <device_name > command. It can be used with or without the -t NLVM option.

Example

all

Command Example

nlvm list devices exclude=raid exclude=nonshared exclude=lvm all

Print detailed information for all non-LVM shared devices that are not software RAID devices.

Response Parameters

You can issue the commands with the --terse NLVM option to output the same information in a format that is more easily parsed.

Standard Output

The command returns the following standard information about the devices on the server:

Device name such as sdb or raid1 Total amount of space on the device in KB, MB, GB, or TB Used space on the device in KB, MB, GB, or TB
Used space on the device in KB, MB, GB, or TB
Available space on the device in KB, MB, GB, or TB
MSDOS, GPT, CSM (legacy EVMS Cluster Segment Manager), LVM (clustered Linux LVM volume), None (not initialized)
Yes or No; whether this device is marked as Shareable for Clustering
Yes or No; whether this is an NSS software RAID device
Yes or No; whether the RAID is enabled on this node
Yes or No; whether this device is cachedev
_

More Output

The command returns the following additional information about the devices on the server:

Label	Description
RAID	Type (0, 1, or 5) or No; type of NSS RAID device, or not a RAID
Sync	Yes or %; whether the RAID is in sync or percent completed
M:M	Major:Minor numbers, such as 8:112
SectorSize(logical /physical)	Logical or physical sector size of a device
Provisioning	Thick or Thin provisioning type

All Output

If the all option is used, the command returns the same information about each device as is displayed for the nlvm list device <device_name> command. This includes information about its partitions, or about its partitions and segments for RAID devices.

Sample Command Responses

Sample 1: nlvm list devices

Name	Size	U	sed	Free	Format	Shared	RAID	Enabled	CACHE
sda	1.63T	з 1.	63TB	0KB	MSDOS	No	No		No
sdb	931.00G	в 20б.	00GB	724.99GB	GPT	No	No		No

6.36 List Linux Volume

list linux volume </x_volume_name>

Print detailed information about a specified Linux volume.

nlvm [nlvm_options] list linux volume <lx_volume_name>

Command Option

lx_volume_name

Mandatory. Specify the name of the Linux POSIX volume.

Use the name format as it is displayed in NSSMU or with the nlvm list volumes command. For a non-LVM that is not NCP-enabled, specify the name as a forward slash with the name of the final directory of the mount point (/<dir_name>). For an LVM volume that is not NCP-enabled, specify the volume name of the LVM logical volume. For an NCP-enabled volume, specify the NCP name.

Examples

LV_VOL1	[ex: an LVM volume that is NCP-enabled]
lv_vol1	[ex: an LVM volume that is not NCP-enabled]
MYLVMVOL	[ex: an LVM volume that is not NCP-enabled]
HOME	[ex: a non-LVM volume that is NCP-enabled]
/home	[ex: a non-LVM volume that is not NCP-
enabled]	

Command Example

nlvm list linux volume MYLVMVOL

Print detailed information about the NCP-enabled LVM volume named MYLVMVOL.

Response Parameters

The Linux volume details include the following. Most labels are self-explanatory.

Label	Description
Name	Volume name. The format of the name depends on the type of volume and whether it is NCP-enabled.
Group	LVM group name or NA (not applicable) for non-LVM volumes

Label	Description
Mounted	Yes or No; whether the volume is mounted for user access
Size	Size of the volume in KB, MB, GB, or TB
Shared	Yes or No; whether volume's device is marked as Shareable for Clustering
Туре	Type of file system (such as btrfs, ext2, ext3, ext4, reiserfs, or xfs)
LVM	Yes or No; whether the volume is an LVM volume
NCP	Yes or No; whether the volume is NCP-enabled
Mountpoint	Full Linux path where the volume is mounted
Path	Path of the device or partition. For LVM, this is typically /dev/ <volume_group_name>/<logical_volume_name>. If it is not LVM, this is the partition path.</logical_volume_name></volume_group_name>
MountOptions	Defaults or specified mount options, such as rw

Sample Command Responses

Sample 1: Non-LVM Volume

```
nlvm list linux volume /home
Name=/home
Group=NA Mounted=Yes Size=3.00GB
Shared=No Type=ext4 LVM=No NCP=No
Mountpoint=/home
Path=/dev/sda3
MountOptions=defaults
```

Sample 2: LVM Volume

```
nlvm list linux volume mylvm
Name=mylvm
Group=ajlvm Mounted=No Size=100.00MB
Shared=No Type=ext4 LVM=Yes NCP=No
Mountpoint=/usr/novell/mylvm
Path=/dev/mylvm/mylvm
MountOptions=rw
```

Sample 3: NCP-Enabled Non-LVM Volume

```
nlvm list linux volume NCP3
Name=NCP3
Group=NA Mounted=Yes Size=103.59MB
Shared=No Type=ext4 LVM=No NCP=Yes
Mountpoint=/usr/novell/NCP3
Path=/dev/sdc3
MountOptions=rw
```

Sample 4: NCP-Enabled LVM Volume

```
nlvm list linux volume LVMNCP
Name=LVMNCP
Group=lvmncp Mounted=No Size=100.00MB
Shared=No Type=ext4 LVM=Yes NCP=Yes
Mountpoint=/usr/novell/lvmncp2
Path=/dev/lvmncp/LVMNCP
MountOptions=rw
```

6.37 List Linux Volumes

list [-t] linux volumes [more | all]

Print a list of Linux POSIX volumes and for each, display its path, mount point, file system type, NCP enabled status, and mount status.

nlvm [-t] list linux volumes [more|all]

Command Options

-t, --terse

Use this NLVM option to format the output for parsing.

more

Prints more information than appears in the standard output. It can be used with or without the $-{\tt t}$ NLVM option.

Example

more

all

Prints detailed information about each of the Linux volumes. This is the same information that is printed for the nlvm list linux volume <volume_name > command. It can be used with or without the -t NLVM option.

Example

all

Command Example

nlvm list linux volumes

Print a list of Linux POSIX volumes and the paths where they are mounted.

Response Parameters

You can issue the commands with the -terse NLVM option to output the same information in a format that is more easily parsed.

Standard Output

The command returns the following standard information about the Linux volumes on the server:

Label	Description
Name	Volume name. The format of the name depends on the type of volume and whether it is NCP-enabled.
Group	LVM group name or NA (not applicable) for non-LVM volumes
Mounted	Yes or No; whether the volume is mounted for user access
Size	Size of the volume in KB, MB, GB, or TB
Shared	Yes or No; whether volume's device is marked as Shareable for Clustering
Туре	Type of file system (such as btrfs, ext2, ext3, reiserfs, or xfs)
LVM	Yes or No; whether the volume is an LVM volume
NCP	Yes or No; whether the volume is NCP-enabled
Mountpoint	Full Linux path where the volume is mounted

More Output

The command returns the following additional information about the Linux volumes on the server:

Label	Description
Path	Path of the device or partition. For LVM, this is typically /dev/ <volume_group_name>/<logical_volume_name>. If it is not LVM, this is the partition path.</logical_volume_name></volume_group_name>

All Output

If the all option is used, the command returns the same information about each Linux volume as is displayed for the nlvm list volume <volume_name> command.

Sample Command Responses

Sample 1: nlvm list linux volumes

Name	Group	Mounted	Size S	hared	Т	ype	LVM	NCP	Mountpoint

6.38 List Move

list move <<move_name>|<pool_name>>

Print detailed information about a specified NSS pool move. It lists the devices you are moving from and the devices you are moving to, such as

from=sdc,sdd,sde to=sdg

If a pool is cluster-enabled, the pool move is enabled and active only on the node where the pool cluster resource is currently online. On other nodes in the cluster, the pool move is not enabled.

nlvm [nlvm_options] list move <<move_name>|<pool_name>>

The move occurs as a low-level block mirror between the original location and the new location. The entire pool area is mirrored. The response reports the number of mirror regions to be moved for the pool relative to the maximum source pool size, which is unrelated to the NSS blocks in use. The region count for the old pool location does not change during the move. The complete parameter indicates the number of regions that have been moved so far and the percentage that it represents of the total number of regions to be moved.

The size of a mirror region is determined internally based on the total size of the mirror. One sector is used to track the number of mirror regions that are currently synchronized. A bit represents a mirror region, and there are 4096 bits total (512 * 8) to track. A shift technique is used so that the mirror region size is always a power of 2 (128, 256, 512, and so on) and the total number of regions to move is less than or equal to 4096. Except for very small mirrors, the number of mirror regions is usually between 2048 and 4096. The minimum mirror region size used is 64 sectors (32 KB). There is no maximum. For an 8 TB pool, the mirror region size is 2 GB. When a complete region is mirrored, the bit is set. If a region is partially mirrored during a system failure or cluster resource migration, the entire region is remirrored when mirroring resumes.

The response lists the set of devices that are being used for the original location (from) and the new location (to).

Command Option

move_name or pool_name

Mandatory. Specify the name of the move, such as POOLNAME_move. You can alternatively specify the pool name.

Example

MYPOOL_move

Command Example

nlvm list move MYPOOL_move

Print detailed information about the MYPOOL_move move.

Response Parameters

The command returns the following information about the specified pool move:

Label	Description
Name	Name of the move. Typically, <pre>pool_name>_move.</pre>
Pool	Name of the pool being moved
FromStat	Status of the "from" group of devices that make up the source pool (Active, ReadError, WriteError, Missing, NotEnabled)
ToStat	Status of the "to" group of devices that make up the new instance of the pool (Active, ReadError, WriteError, Missing, NotEnabled)

Label	Description
Complete	Percent complete
OldSize	Size of the old/source pool in MB, GB, or TB, and the number of whole sectors in that space
From	From set of devices for the pool being moved
То	To set of devices for the pool in its new location
M:M	Major:minor numbers of the move object
Regions	Total number of mirror regions to be moved
RegionsComplete	Number of mirror regions that are complete

Sample Command Responses

Sample 1: nlvm list move MYPOOL_move

```
Name=MYPOOL_move
Pool=MYPOOL FromStat=Active ToStat=Active Complete=100%
OldSize=99.00MB(202752) From=sdb To=sdc
M:M=253:21 Regions=3168 RegionsComplete=3168
```

Sample 2: Cluster Node where the Pool Cluster Resource Is Active

```
Name=CLUSPOOL_move
Pool=CLUSPOOL FromStat=Active ToStat=Active Complete=33%
OldSize=7.19GB(15087616) From=sdc,sdd,sde,sdf To=sdh
M:M=253:21 Regions=3684 RegionsComplete=1245
```

Sample 3: Any Cluster Node where the Pool Cluster Resource Is Not Active

```
Name=CLUSPOOL_move
Pool=CLUSPOOL FromStat=NotEnabled ToStat=NotEnabled
From=sdc,sdd,sde,sdf To=sdh
Move is not enabled on this node.
```

6.39 List Moves

list moves [more | all]

Print a list of current NSS pool moves.

If a pool is cluster-enabled, the pool move is enabled and active only on the node where the pool cluster resource is currently online. On other nodes in the cluster, the pool move is not enabled.

nlvm [-t] list moves [more all]

Command Options

-t, --terse

Use this NLVM option to format the output for parsing.

more

Prints more information than appears in the standard output. It can be used with or without the -t NLVM option.

Example

more

all

Prints detailed information about each of the pool moves. This is the same information that is printed for the nlvm list moves <move_name> command. It can be used with or without the -t NLVM option.

Example

all

Command Example

nlvm list moves

Print a list of NSS pool moves that are in progress now.

Response Parameters

You can issue the commands with the --terse NLVM option to output the same information in a format that is more easily parsed.

Standard Output

The command returns the following standard information about the pool moves on the server:

Label	Description
Name	Name of the move. Typically, <pre>pool_name>_move.</pre>
Pool	Name of the pool being moved
FromStat	Status of the "from" group of devices that make up the source pool (Active, ReadError, WriteError, Missing, NotEnabled)
ToStat	Status of the "to" group of devices that make up the new instance of the pool (Active, ReadError, WriteError, Missing, NotEnabled)
Complete	Percent complete

More Output

The command returns the following additional information about the pool moves on the server:

Label	Description
OldSize	Size of the old/source pool in MB, GB, or TB, and the number of whole sectors in that space
From	From set of devices for the pool being moved
То	To set of devices for the pool in its new location

All Output

If the all option is used, the command returns the same information about each pool move as is displayed for the nlvm list move <move_name> command.

Sample Command Responses

Sample 1: Server with No Active Moves

nlvm list moves No moves

Sample 2: nlvm list moves

Name Pool FromStat ToStat Complete MYPOOL_move MYPOOL Active Active 100%

Sample 3: nlvm list moves --terse

Name=PMOVE_move Pool=PMOVE FromStat=Active ToStat=Active Complete=100%

Sample 6: Cluster Node where the Pool Cluster Resource Is Active

Name Pool FromStat ToStat Complete MYPOOL_move MYPOOL Active Active 71%

Sample 7: Any Cluster Node where the Pool Cluster Resource Is Not Active

Name Pool FromStat ToStat Complete MYPOOL_move MYPOOL NotEnabled NotEnabled 0% Move is not enabled on this node.

6.40 List Partition

list partition <partition_name>

Print detailed information about a specified partition.

nlvm [nlvm_options] list partition <partition_name>

Command Option

partition_name

Mandatory. Specify the node name (such as sdc1.1) for the partition.

Example

sdc1.1

Command Example

nlvm list partition sdc1.1

Print detailed information about the /dev/sdc1.1 partition.

Response Parameters

The command returns the following information about the specified partition:

Label	Description
Name	Name of the partition
Туре	Partition type in both hex and type name if known
Start	Starting sector of the partition
Size	Size of the partition in MB, GB, or TB, and the number of whole sectors that consist in that space
Device	Device the partition is on, such as sda or raid1 or MYCACHEDEV1
Shared	Whether the partition is marked Shareable for Clustering (1, 0)
M:M	Major:minor numbers of the partition (if applicable)
Pool	Name of the NSS pool using this partition (if applicable)
Label	Label for SBD partition (if applicable). Typically, the same as the cluster name.

Sample Command Responses

Sample 1: Linux Swap Partition

nlvm list partition sdal

```
Name=sda1
Type=82(Linux Swap) Start-2048 Size=1.00GB(2103296)
Device=sda Shared=No M:M=8:1 Pool=None
```

Sample 2: NSS Pool Partition

nlvm list partition sdd1.1

```
Name=sdd1.1
Type=169(NSS) Start=32 Size=1023.96MB(2097088)
Device=sdd Shared=No M:M=0:0 Pool=TEST2
```

Sample 3: NSS RAID Partition

nlvm list partition sdel.2

```
Name=sde1.2
Type=1CF(NSS_Raid) Start=204832 Size=100.01MB(204832)
Device=sde Shared=No M:M=0:0 Pool=None
```

Sample 4: NSS Pool Snapshot Partition

nlvm list partition sdi6.1
Name=sdi6.1
Type=1AC(Snapshot) Start=206880 Size=75.00MB(153600)
Device=sdi Shared=No M:M=253:17 Pool=SNAP1

Sample 5: OES Cluster Services SBD Partition

```
nlvm list partition clstr.sbd
Name=clstr.sbd
Type=1AD(Cluster) Start=32 Size=100.00MB(204800)
Device=sde Shared=No M:M=253:4 Pool=None
Label: clstr
```

Sample 6: Linux Partition

nlvm list partition sdc1

```
Name=sdc1
Type=83(Linux) Start=32 Size=103.57MB(212128)
Device=sdc Shared=No M:M=8:33 Pool=None
```

Sample 7: Linux LVM Partition

nlvm list partition sdc2

```
Name=sdc2
Type=8E(Linux_LVM) Start=212160 Size=103.59MB(212160)
Device=sdc Shared=No M:M=8:34 Pool=None
```

Sample 8: DOS Extended Partition

nlvm list partition sdc4

```
Name=sdc4
Type=5(DOS_Extended) Start=530400 Size=765.00MB(1566720)
Device=sdc Shared=No M:M=8:36 Pool=None
```

Sample 8: Cachedev Partition

```
nlvm list partition MYCACHEDEV11.3
```

```
Name=MYCACHEDEV11.3
Type=191(NSS_CACHE) Start=2621504 Size=256.00MB(524288)
Device=MYCACHEDEV1 Shared=No M:M=0:0 Pool=None
Label: CPOOL2
```

6.41 List Partitions

list partitions [device] [mask] [more | all]

Print a list of partitions based on the options. If no command options are specified, all data partitions are listed.

nlvm [-t] list partitions [device] [mask] [more all]

Command Options

device=device_name

Print a list of the partitions on the specified device.

Example

device=sdb

mask=<free|all|nss|nssfree>

Print a list of the partitions that meet the specified mask option.

Mask Options

free

Print a list of only the free space partitions.

all

Print a list of both data and free space partitions.

nss

Print a list of only NSS type partitions.

nssfree

Print a list of free space that can be used to create NSS partitions. This option combines contiguous free space together to give a true view of available space.

Example

mask=nss

-t, --terse

Use this NLVM option to format the output for parsing.

more

Prints more information than appears in the standard output. It can be used with or without the $-{\tt t}$ NLVM option.

Example

more

all

Prints detailed information about each of the partitions. This is the same information that is printed for the nlvm list partition command.It can be used with or without the -t NLVM option.

Example

all

Command Example

nlvm list partitions device=sdb mask=nss

Print a list of partitions of type nss on the /dev/sdb device.

Response Parameters

You can issue the commands with the --terse NLVM option to output the same information in a format that is more easily parsed.

Standard Output

The command returns the following information about the partitions on the server:

Label	Description
Name	Name of the partition
Туре	Partition type in both hex and type name if known
Start	Starting sector of the partition
Size	Size of the partition in MB, GB, or TB
Device	Device the partition is on, such as sda or raid1 or MYCACHEDEV1

More Output

The command returns the following additional information about the partitions on the server:

Label	Description	
Shared	Whether the partition is marked Shareable for Clustering (1, 0)	
M:M	Major:minor numbers of the partition (if applicable)	
Pool	Name of the NSS pool using this partition (if applicable)	

All Output

If the all option is used, the command returns the same information about each partition as is displayed for the nlvm list partition command.

Sample Command Responses

Sample 1: nlvm list partitions

nlvm list partitions

6.42 List Pool

list pool <pool_name>

Print detailed information about a specified NSS pool including its pool type (NSS64 or NSS32).

nlvm [nlvm_options] list pool <pool_name>

Command Option

pool_name

Mandatory. Specify the name of the NSS pool.

Example

MYPOOL1

Command Example

nlvm list pool MYPOOL1

Print detailed information about the pool MYPOOL1.

Response Parameters

The command returns the following information about the specified pool:

Label	Description
Name	Name of the pool
State	State of the pool (Active, Deactive, Maintenance, Unknown, Not Mounted (for snapshot pool))
Туре	Type of the pool (NSS64 or NSS32-bit pool)
Size	Size of the pool in MB, GB, or TB

Label	Description				
Shared	Yes or No; whether the pool's device is marked as Shareable for Clustering				
IsSnap	Yes or No; whether the pool is a snapshot				
Used	Used space in the pool in KB, MB, GB, or TB				
Free	Free space in the pool in KB, MB, GB, or TB				
Segs	Number of segments in the pool				
Volumes	Number of volumes in the pool				
Snapshots	Number of snapshots, or No				
Move	Name of the pool move (if applicable), or No				
Status	Status of the pool move (if applicable)				
Complete	Percent complete for the pool move (if applicable)				
SnapshotNames	Names of the pool snapshots (if applicable)				
Created	If the pool is mounted, the date and time the pool was created				

The command returns the following information about the pool's segments:

Label	Description
Index	Index number of the segment
Start	Starting offset in the pool
Next	Next offset in the pool
Size	Size of the segment in MB, GB, or TB
Partition	Partition name for this segment

The command returns the following information about each of the pool's volumes if the pool is active and it has volumes:

Label	Description
Volume	Volume name
State	Volume state (Active, Deactive)
Mounted	Yes or No; whether the volume is mounted for user access
Quota	Volume quota in MB, GB, or TB, or None (if the volume can grow to the size of the pool)
Used	Used size of the volume in KB, MB, GB, or TB
Free	Free size of the volume in KB, MB, GB, or TB

Sample Command Responses

6.43 List Pools

list pools [exclude] [more | all]

Print a list of all NSS pools.

nlvm [-t] list pools [exclude] [more|all]

Command Options

exclude=<nss|shared|nonshared|snap|snapnomount>

Specify types of pools to exclude from the list. The exclude option can be used multiple times to add exclusions.

Exclude Options

nss

NSS pools

shared

Shared pools

nonshared

Pools that are not shared

snap

Snapshot pools that are mounted

snapnomount

Snapshot pools that are not mounted

Example

exclude=snap exclude=snapnomount

-t, --terse

Use this NLVM option to format the output for parsing.

more

Prints more information than appears in the standard output. It can be used with or without the -t NLVM option.

Example

more

```
all
```

Prints detailed information about each of the NSS pools. This is the same information that is printed for the nlvm list pool pool_name command. It can be used with or without the -t NLVM option.

Example

all

Command Example

nlvm list pools more exclude=shared

Print detailed information about each of the pools, but exclude shared pools.

Response Parameters

You can issue the commands with the --terse NLVM option to output the same information in a format that is more easily parsed.

Standard Output

The command returns the following information about the pools on the server:

Label	Description
Name	Name of the pool
State	State of the pool (Active, Deactive, Maintenance, Unknown, Not Mounted (for snapshot pool))
Туре	Denotes the type of pool (NSS64 or NSS32 pool)
Size	Size of the pool in MB, GB, or TB
Shared	Yes or No; whether the pool's device is marked as Shareable for Clustering
IsSnap	Yes or No; whether the pool is a snapshot

More Output

The command returns the following additional information about the pools on the server:

Label	Description
Used	Used space in the pool in KB, MB, GB, or TB
Free	Free space in the pool in KB, MB, GB, or TB
Segs	Number of segments in the pool
Volumes	Number of volumes in the pool
Move	If there is a pool move, its percent complete; or No

All Output

If the all option is used, the command returns the same information about each pool as is displayed for the nlvm list pool command.

Sample Command Response

Sample 1: nlvm list pools

nlvm list pools

Name	State	Туре	Size Sha	red	IsSnap

6.44 List Snap

list snap <snap_name>

Print detailed information about a specified snapshot.

nlvm [nlvm_options] list snap <snap_name>

Command Example

nlvm list SNAP1

Print detailed information about SNAP1.

Response Parameters

The command returns the following information about the specified pool snapshot:

Label	Description
Name	Name of the snapshot
Pool	Name of the pool being snapped
Mounted	Yes or No; whether the snapshot is mounted as a pool
Size	Size of the pool in MB, GB, or TB
Shared	Yes or No; whether the snapshot's device is marked as Shareable for Clustering. Typically, No, because snapshots are not supported for clustered pools at this time.
PoolSize	Source pool in KB, MB, GB, or TB
Chunk	Snapshot chunk size in KB (ex: 128)
Full	Percent of space on the partition that is used for copy-on-write-data
PartSize	Partition size in MB, GB, or TB, and the number of whole sectors in that space
Partition	Name of the partition for the snapshot
M:M	Major:minor of the snapshot object
Writeable	Yes or No; whether the snapshot is writeable

Sample Command Responses

Sample 1: Snap Is Not Mounted

nlvm list snap SNAPSHOT1

```
Name=SNAPSHOT1
Pool=BIGLONGPOOLNAME Mounted=No Shared=No
PoolSize=99.98MB Chunk=128 Full=1%
PartSize=50.00MB(102400) Partition=sde7.1
M:M=253:8 Writeable=Yes
```

Sample 2: Snap Is Mounted

nlvm list snap SNAP1

```
Name=SNAP1
Pool=POOL1 Mounted=Yes Shared=No
PoolSize=99.00MB Chunk=128 Full=12%
PartSize=75.00MB(153600) Partition=sdi6.1
M:M=253:19 Writeable=Yes
```

6.45 List Snaps

list snaps [more | all]

Print a list of all NSS pool snapshots. For each, display its pool name and its mount state.

nlvm [-t] list snaps [more all]

Command Options

-t, --terse

Use this NLVM option to format the output for parsing.

more

Prints more information than appears in the standard output. It can be used with or without the $-{\tt t}$ NLVM option.

Example

more

all

Prints detailed information about each of the snapshots. This is the same information that is printed for the nlvm list snapshot <snap_name> command. It can be used with or without the -t NLVM option.

Example

all

Command Example

nlvm list snaps more

Print a list of all snapshots and detailed information about each one.

Response Parameters

You can issue the commands with the --terse NLVM option to output the same information in a format that is more easily parsed.

Standard Output

The command returns the following information about the pool snapshots on the server:

Label	Description
Name	Name of the snapshot
Pool	Name of the pool being snapped
Mounted	Yes or No; whether the snapshot is mounted as a pool
Size	Size of the pool in MB, GB, or TB
Shared	Yes or No; whether the snapshot's device is marked as Shareable for Clustering. Typically, No, because snapshots are not supported for clustered pools at this time.

More Output

The command returns the following additional information about the pool snapshots on the server:

Label	Description
PoolSize	Source pool in KB, MB, GB, or TB
Chunk	Snapshot chunk size in KB (ex: 128)
Full	Percent of space on the partition that is used for copy-on-write-data
PartSize	Partition size in MB, GB, or TB, and the number of whole sectors in that space
Partition	Name of the partition for the snapshot

All Output

If the all option is specified, the information returned for each pool snapshot is the same as for the nlvm list snap <*snap_name*> command.

Sample Command Response

Sample 1: nlvm list snaps

nlvm list snaps

Name	Pool	Mounted	Shared
SNAP1	POOL1	Yes	No
SNAPSHOT1	BIGLONGPOOLNAME	No	No

Sample 2: nlvm list snaps more

nlvm list snaps more

Name	Pool	Mounted	Shared	PoolSize	Chunk	Full	PartSize
Partition							
SNAP1	POOL1	Yes	No	99.00MB	128	12%	75.00MB sdi6.1
SNAPSHOT1	BIGLONGPOOLNAME	No	No	99.98MB	128	1%	50.00MB sde7.1

Sample 3: nlvm list snaps all

nlvm list snaps all

Name=SNAP1 Pool=POOL1 Mounted=Yes Shared=No PoolSize=99.00MB Chunk=128 Full=12% PartSize=75.00MB(153600) Partition=sdi6.1 M:M=253:19 Writeable=Yes Name=SNAPSHOT1 Pool=BIGLONGPOOLNAME Mounted=No Shared=No

Sample 4: nlvm list snaps all --terse

nlvm list snaps all --terse

Name=SNAP1 Pool=POOL1 Mounted=Yes Shared=No PoolSize=99.00MB Chunk=128 Full=12% PartSize=75.00MB(153600) Partition=sdi6.1 M:M=253:19 Writeable=Yes

Name=SNAPSHOT1 Pool=BIGLONGPOOLNAME Mounted=No Shared=No PoolSize=99.98MB Chunk=128 Full=1% PartSize=50.00MB(102400) Partition=sde7.1 M:M=253:8

6.46 List Volume

list volume <volume_name>

Print detailed information about a specified NSS volume.

nlvm [nlvm_options] list volume <volume_name>

Command Option

volume_name

Mandatory. Specify the name of the NSS volume.

Example

MYVOL1

Command Example

nlvm list volume MYVOL1

Print detailed information about the volume MYVOL1.

Response Parameters

The command returns the following information about the specified NSS volume:

Label	Description
Name	Name of the volume
Pool	Name of the pool
State	Volume state (Active, Deactive)
Mounted	Yes or No; whether the volume is mounted for user access
Shared	Yes or No; whether the volume's device is marked Shareable for Clustering
Mountpoint	Full Linux path where the volume is mounted; typically, /media/nss/ <volume_name></volume_name>
Used	Amount of used space in KB, MB, GB, or TB
Avail	Amount of available space (free space plus purgeable space) in KB, MB, GB, or TB
Quota	None, or amount of the volume quota in MB, GB, or TB
Purgeable	Amount of purgeable space in KB, MB, GB, or TB
Attributes	Volume attributes (such as Salvage, Compression, User Space Quotas, Directory Quotas, Encrypted)
ReadAheadBlocks	Setting for the Read Ahead Blocks parameter
PrimaryNameSpace	Primary lookup name space; the default is LONG
Objects	Number of objects
Files	Number of files

Label	Description
BlockSize	Block size; typically, 4096 bytes
ShredCount	Number of shredding cycles (1 to 7), where 0 is no shredding
AuthModelID	Authentication model ID (1, 0)
SupportedNameSpaces	Supported name spaces (DOS, MAC, UNIX, LONG)
CreateTime	Date created (Day Month dd hh:mm:ss yyyy)
ArchiveTime	Date last archived (Never , Day Month dd hh:mm:ss yyyy), or Never

Sample Command Response

Sample 1: NSS Volume, Mounted, Unshared

nlvm list volume NSS1

```
Name=NSS1

Pool=POOL1 State=Active Mounted=Yes Shared=No

Mountpoint=/media/nss/NSS1

Used=1.28MB Avail=87.27MB Quota=None Purgeable=12KB

Attributes=Salvage,Compression,Encrypted[AES128]

ReadAheadBlocks=16 PrimaryNameSpace=LONG

Objects=28 Files=23

BlockSize=4096 ShredCount=1 AuthModeIID=1

SupportedNameSpaces=DOS,MAC,UNIX,LONG

CreateTime: Wed May 22 16:03:26 2013

ArchiveTime: Never
```

Sample 2: NSS Volume, Not Mounted, Unshared

nlvm list volume NSS1

Name=NSS1 Pool=POOL1 State=Dective Mounted=No Shared=No Mountpoint=/media/nss/NSS1 CreateTime: Wed May 22 16:03:26 2013 ArchiveTime: Never

Sample 3: NSS Snapshot Volume, Mounted, Unshared

```
nlvm list volume NSS1_SV
```

```
Name=NSS1_SV

Pool=SNAP1 State=Active Mounted=Yes Shared=No

Mountpoint=/media/nss/NSS1_SV

Used=572KB Avail=88.05MB Quota=None Purgeable=12KB

Attributes=Salvage,Compression,Encrypted[AES128]

ReadAheadBlocks=16 PrimaryNameSpace=LONG

Objects=15 Files=15

BlockSize=4096 ShredCount=1 AuthModelID=1

SupportedNameSpaces=DOS,MAC,UNIX,LONG

CreateTime: Wed Jun 5 16:57:21 2013

ArchiveTime: Never
```

6.47 List Volumes

list volumes [more|all]

Print a list of NSS volumes on the system. For each, display its pool name and volume state (active or deactive).

```
nlvm [-t] list volumes [more all]
```

Command Options

-t, --terse

Use this NLVM option to format the output for parsing.

more

Prints more information than appears in the standard output. It can be used with or without the $-{\tt t}$ NLVM option.

Example

more

```
all
```

Prints detailed information about each of the NSS volumes. This is the same information that is printed for the nlvm list volume <nss_volume_name > command. It can be used with or without the -t NLVM option.

Example

all

Command Example

nlvm list volumes [more]

Print a list of NSS volumes, and display detailed information about each volume.

Response Parameters

You can issue the commands with the --terse NLVM option to output the same information in a format that is more easily parsed.

Standard Output

The command returns the following information about the NSS volumes on the server:

Label	Description			
Name	Name of the volume			
Pool	Name of the pool			
State	Volume state (Active, Deactive)			
Mounted	Yes or No; whether the volume is mounted for user access			
Shared	Yes or No; whether the volume's device is marked Shareable for Clustering			

More Output

The command returns the following additional information about the NSS volumes on the server:

Label	Description			
Used	Amount of used space in KB, MB, GB, or TB			
Avail	Amount of available space (free space plus purgeable space) in KB, MB, GB, or TB			
Quota	None, or amount of the volume quota in MB, GB, or TB			
Attributes	Volume attributes (such as Salvage, Compression, User Space Quotas, Directory Quotas, Encrypted)			

All Output

If the all option is specified, the information returned for each volume is the same as for the list volume <volume_name > command.

Sample Command Response

Sample 1: nlvm list volumes

nlvm list volumes

Name	Pool	State	Mounted	Shared

```

6.48 Mount

mount <pool_name>

Mount a specified NSS pool.

nlvm [nlvm_options] mount <pool_name>

Command Option

pool_name

Mandatory. Specify the name of the NSS pool to mount.

The nlvm mount command internally sets the $-\mathfrak{m}$ flag, so only the specified pool is mounted.

Example

MYPOOL1

Command Example

nlvm mount MYPOOL1

Mount the pool MYPOOL1.

6.49 Move

move <pool_name> <device> <size> [<device> <size>...]

Move an NSS pool from one location to another on the same system. If the new location is larger than the original location, the pool is automatically expanded after the move is complete.

nlvm [nlvm_options] move <pool_name> <device> <size> [<device> <size>...]

You can use the device and size combination multiple times to create a move target comprised of multiple segments. You must specify a size for each device. The device and size options can be used in any order. The first device instance is matched to the first size instance, and so on. The move target's size is the sum of the space contributed from the specified segments.

The total size of the target must be at least as big as the pool. You cannot shrink a pool by using the move command. If the size is larger, the pool size is expanded when the move is complete.

If a pool is cluster-enabled, issue the command on the node where the pool cluster resource is currently online. The move advances only when the resource is online. If the pool cluster resource is cluster migrated to another node, the move is enabled and active on the new node when the resource is brought online, and then the pool move continues. The status of the pool move can be reported only on the node where the resource is online.

The move command uses NSS software RAID mirroring underneath to copy the data to the target location. If server performance is too slow during a move, you can temporarily pause the mirroring with the nlvm pause move command. While the move is paused, the pool move status is reported as Not Enabled. Resume the mirroring with the nlvm resume move command. The pool move continues from where it was paused. The move will automatically resume in a cluster setup under certain conditions. See the nlvm resume move command for details.

You can check the status of a pool move by using the nlvm list move command.

When the move status is 100% complete, it is not yet final. You can issue the nlvm complete move <move_name> command to finalize the move. This sets the pool to the new location and removes the original location. Other NSS utilities might also complete the move. For information, see "Moving a Pool" in the OES 23.4: NSS File System Administration Guide for Linux.

You can delete a pool move by using the nlvm delete move command with the abort option. This sets the pool back to the original location and removes the new location.

In a cluster, issue the commands to complete, delete, or list the pool move from the node where the pool cluster resource is currently online.

Command Options

pool_name

Mandatory. Specify the name of the NSS pool to be moved. This must be the first command option.

Example

MYPOOL1

device=device_name

Mandatory. Specify the target device where the pool will be relocated.

You can specify multiple device instances to create a move target comprised of multiple segments. Each device instance must have a matching size instance. The first device instance is matched to the first size instance, and so on.

Example

device=sdg

size=<value[K|M|G|T]|max>

Mandatory. Specify the size of the target partition. The size must be the same size or larger than the source pool.

If multiple devices are specified, each device instance must have a matching size instance. The first size instance is matched to the first device instance, and so on.

Example

size=200G
size=3.98T

Command Examples

nlvm move MYPOOL1 device=sdg size=200G

Move the NSS pool named MYPOOL1 to the $/{\tt dev}/{\tt sdg}$ device and allocate 200 GB to the partition.

nlvm move MYPOOL1 device=sdg size=200G device=sdh size=500G

Move the NSS pool named MYPOOL1 to a 700 GB space comprised of 200 GB of free space from device sdg and 500 GB of free space from device sdh.

6.50 Pause Move

pause move <move_name | pool_name>

Temporarily pause the mirroring for a specified pool move. While the move is paused, the pool move status is reported as Not Enabled.

nlvm [nlvm_options] pause move <move_name | pool_name>

The move command uses NSS software RAID mirroring underneath to copy the data to the target location. If server performance is too slow during a move, you can use this command to temporarily pause the mirroring. For example, you can pause the move during the server's peak usage times, and resume the move during the server's off-peak usage times.

Use the nlvm resume move command to resume mirroring for the pool move.

Command Option

move_name

Mandatory. Specify the name of the pool move that you want to pause. The move name typically looks like POOLNAME_move.

pool_name

Mandatory. Specify the name of the NSS pool that is being moved.

Example

MYPOOL1

Command Example

nlvm pause move MYPOOL1

Temporarily pause the mirroring for the pool move for the pool MYPOOL1.

6.51 Pool Activate

pool activate <pool_name>

Activate a specified NSS pool.

nlvm [nlvm_options] pool activate <pool_name>

Command Option

pool_name

Mandatory. Specify the name of the NSS pool to activate.

Example

MYPOOL1

Command Example

nlvm pool activate MYPOOL1

Activate the pool MYPOOL1.

6.52 Pool Deactivate

pool deactivate <pool_name>

Deactivate a specified NSS pool.

nlvm [nlvm_options] pool deactivate <

Command Option

pool_name

Mandatory. Specify the name of the NSS pool to deactivate.

Example

MYPOOL1

Command Example

nlvm pool deactivate MYPOOL1

Deactivate the pool MYPOOL1.

6.53 RAID

raid <raid_action> <raid_name>

Perform actions on an NSS software RAID device.

nlvm [nlvm_options] raid <raid_action> <raid_name>

RAID Actions

abort <raid_name>

Abort the restripe or remirror currently in progress on the specified NSS software RAID. If the restripe/remirror is complete, the command has no effect.

Example

nlvm raid abort MYRAID1

delete <raid_name>

Delete a single element mirror from a pool, and leave the pool on the corresponding partition. This applies for RAID 1 (mirror) objects only.

This is a duplicate of the nlvm delete raid command, but it is added here for support reasons. This command removes only a single element mirror object.

Example

nlvm raid delete MYRAID1

disable <raid_name>

Disable an NSS software RAID device from remirroring or restriping on this server, and do not allow stamp updates to occur.

This command is used in OES Cluster Services clusters to disable an NSS software RAID device that is active on another node.

Example

nlvm raid disable MYRAID1

enable <raid_name>

Enable a RAID device to remirror or restripe on this server. This enables an NSS software RAID device that was disabled by using the nlvm raid disable command.

This command is used in OES Cluster Services clusters to enable an NSS software RAID device for this node. It is important that the RAID device be enabled on only one node at a time.

WARNING: Use caution when in a cluster configuration to avoid possible corruption that can occur if the RAID is enabled on multiple nodes at the same time.

Example

nlvm raid enable MYRAID1

force <raid_name>

Force a single element mirror to be in sync. This condition can occur if a mirror element was removed, and the last element shows that it is not in sync due to a crash after a successful remirror. This command is only valid on NSS software RAID 1 (mirror) devices.

If you have a single element RAID 1 where the element shows out of sync, you can alternatively put it into sync (if you feel that it has all of the data) by selecting the Restripe (F6) function on the Software RAID page in NSSMU.

WARNING: If a remirror has not completed successfully on this element, using the nlvm raid force command causes the element to look in sync, but the data is not there, and is corrupt. Use this command only if you know that a remirror was completed successfully on this element.

Example

nlvm raid force MYRAID1

pause <raid_name>

Pause a remirror process to allow other I/O to happen during a heavy I/O process. This command is valid only on NSS software RAID 1 (mirror) devices. Because remirroring can cause many I/Os to the devices, a pause allows other I/Os to happen more quickly.

The device must be resumed again by using the nlvm raid resume command. The pause is intended to be used only for a short time.

Example

nlvm raid pause MYRAID1

remirror <raid_name>

Restart a remirror or restripe process on the specified NSS software RAID device that has either been aborted or has failed.

Examples

```
nlvm raid remirror MYRAID1
nlvm raid remirror MYRAID5
```

resume <raid_name>

Resume a remirror process that was paused by using the nlvm raid pause command. This command is valid only on NSS software RAID 1 (mirror) devices.

Example

nlvm raid resume MYRAID1

status [raid_name]

Check the status on one or all NSS software RAID devices. The name is optional. If a name is specified, it returns detailed status for the given RAID device. If the name is omitted, it returns the status for all the NSS software RAID devices on the server.

Examples

nlvm raid status MYRAID1 nlvm raid status

Command Option

raid_name

Mandatory where specified. Specify the name of the NSS software RAID device to be acted upon.

Example

MYRAID1

Sample Command Responses

Sample 1: RAID Status During a Remirror

```
nlvm raid status LH_DFS01_01_R1
```

```
LH_DFS01_01_R1 is remirroring at 9%
--> D1_LH-DFS01-1_part1.1 (100%) In Sync
--> D2_LH-DFS01-1_part1.1 (9%) Out of Sync
```

Sample 2: RAID Status During a Remirror on a Cluster Node where the RAID Is Not Active

nlvm raid status

LH_DFS01_01_R1 is remirroring at 5% LH_DFS02_R1 is Synchronized tst-nda04150cl.sbd is not active on this node

6.54 Rename Pool

rename pool <pool_name> <new_pool_name>

Rename a specified NSS pool.

nlvm [nlvm_options] rename pool <pool_name> <new_pool_name>

Command Option

pool_name

Mandatory. Specify the name of the NSS pool to rename.

Example

MYPOOL1

new_pool_name

Mandatory. Specify the new name of the NSS pool.

For pool naming conventions, see the create pool command.

Example

P_SALES

Command Example

```
nlvm rename pool MYPOOL1 P_SALES
```

Rename the pool MYPOOL1 as P_SALES.

6.55 Rename Cachedev

rename cachedev <cachedev_name> <new_cachedev_name>

Rename a specified NSS cache device.

nlvm [nlvm_options] rename cachedev <cachedev_name> <new_cachedev
_name>

Command Option

cachedev_name

Mandatory. Specify the name of the NSS cache device to rename.

Example

MYCACHEDEV1

new_cachedev_name

Mandatory. Specify the new name of the NSS cache device. See the create cachedev command for cache device naming conventions.

Example

MYCACHEDEV2

Command Example

nlvm rename cachedev MYCACHEDEV1 MYCACHEDEV2

Rename the cache device MYCACHEDEV1 as MYCACHEDEV2.

6.56 Rename RAID

rename raid <raid_name> <new_raid_name>

Rename a specified NSS software RAID device.

If the RAID device is shared, issue the command on the node where the device is currently online.

nlvm [nlvm_options] rename raid <raid_name> <new_raid_name>

Command Option

raid_name

Mandatory. Specify the name of the NSS software RAID device to rename.

Example

MYRAID1

new_raid_name

Mandatory. Specify the new name of the NSS software RAID device. See the create raid command for RAID naming conventions.

Example

R1_SALES

Command Example

nlvm rename raid MYRAID1 R1_SALES

Rename the NSS software RAID device MYRAID1 as R1_SALES.

6.57 Rename Volume

rename volume <volume_name> <new_volume_name> [encryption_password]

Rename a specified NSS volume. If the volume is encrypted, you might also need to provide its encryption password.

If a volume's pool is cluster-enabled, issue the command on the node where the pool cluster resource is currently online.

nlvm [nlvm_options] rename volume <volume_name> <new_volume_name>
[encryption_password]

Command Option

volume_name

Mandatory. Specify the name of the NSS volume to rename.

Example

MYVOL1

new_volume_name

Mandatory. Specify the new name of the NSS volume.

Volume names are 2 to 15 characters. The naming conventions are the same as for pools. See the create pool command for naming conventions.

Example

V_SALES

encryption_password

Optional. If the volume is encrypted, the volume's encryption password might be needed. You can try the command without the password. If the password is needed, you are prompted to enter it.

Example

novell

Command Example

nlvm rename volume MYVOL1 V_SALES

Rename the NSS volume MYVOL1 as V_SALES.

nlvm rename volume MYVOL2 V_FINANCE novell

Rename the encrypted NSS volume MYVOL2 as V_FINANCE. In this example, the encryption password is novell.

6.58 Rescan

rescan

Performs a rescan of the storage objects (such as partitions, NSS pools, and NSS software RAIDs) on known devices, and creates any Device Mapper device or partition objects, or updates them as needed. It also mounts all pools that are not mounted unless you use the -m option. There are no command options.

nlvm [nlvm_options] rescan

Command Example

nlvm rescan

Scans for storage objects, creates and updates Device Mapper objects, and mounts pools as needed.

6.59 Resume Move

resume move <move_name | pool_name>

Resume the mirroring for a specified pool move that has been paused with the nlvm pause move command. The pool move continues from where it was paused.

nlvm [nlvm_options] resume move <move_name | pool_name>

If the pool is cluster-enabled, you must issue the command on the node where the pool is currently active. You cannot resume a paused pool move while the pool cluster resource is offline. A paused pool move for a clustered pool will resume automatically:

- If the pool cluster resource fails over to a different node
- If you cluster migrate the pool cluster resource to a different node
- If you take the pool cluster resource offline and bring it online again

To re-pause the pool move, use the nlvm pause move command.

Command Option

move_name

Mandatory. Specify the name of the paused pool move that you want to resume. The move name typically looks like POOLNAME_move.

pool_name

Mandatory. Specify the name of the NSS pool that is being moved.

Example

MYPOOL1

Command Example

nlvm resume move MYPOOL1

Resume mirroring for the pool move for the pool MYPOOL1.

6.60 Share

share <device_name>

Set the specified device as shared.

nlvm [nlvm_options] share <device_name>

Command Option

device_name

Mandatory. Specify the device to be shared.

You can enter multiple devices by separating the device names with a comma and no spaces.

Examples

sdb sde,sdf,sdg

Command Example

nlvm share sdb

Sets the /dev/sdb device as shared.

nlvm share sde,sdf,sdg

Sets the /dev/sde, /dev/sdf, and /dev/sdg devices as shared.

6.61 Unmount

unmount <pool_name>

Unmount a specified NSS pool. This removes the pool from NSS and causes any open files to be closed and any volumes to be deactivated. It also removes the Device Mapper object for the pool, the link to the Device Mapper object, and the mount point for the pool. This allows you to gracefully log out the server from an iSCSI device that contains a pool. Use this command with caution.

nlvm [nlvm_options] unmount <pool_name>

Command Option

pool_name

Mandatory. Specify the name of the NSS pool to unmount.

Use the unmount command to temporarily unload a pool in order to manage underlying devices. Pools are by design auto mounted. Therefore, running the nssmu utility, or running most nlvm commands without the -m option can cause an unmounted pool to be remounted if underlying devices and partitions still exist. To execute an nlvm command without mounting the unmounted pools, you must include the -m option. The nlvm mount command internally sets the -m flag, so only the specified pool is mounted.

Example

MYPOOL1

Command Example

nlvm unmount MYPOOL1

Unmount the pool MYPOOL1.

6.62 Unshare

unshare <device_name>

Set the specified device as not shared.

nlvm [nlvm_options] unshare <device_name>

Command Option

device_name

Mandatory. Specify the device to be unshared.

You can enter multiple devices by separating the device names with a comma and no spaces.

Examples

sdb sde,sdf,sdg

Command Example

nlvm unshare sdb

Sets the /dev/sdb device as not shared.

nlvm unshare sde,sdf,sdg

Sets the /dev/sde, /dev/sdf, and /dev/sdg devices as not shared.

6.63 Volume Mount

volume mount <volume_name> [encryption_password]

Mount a specified NSS volume. This also activates the volume before mounting it.

nlvm [nlvm_options] volume mount <volume_name> [encryption_password]

Command Options

volume_name

Mandatory. Specify the name of the NSS volume to mount.

Example

MYVOL

encryption_password

Optional. The password is required to mount an encrypted NSS volume on the first mount after a reboot. Thereafter, the password is stored encrypted in system memory until the next server reboot.

Example

novell

Command Examples

nlvm volume mount MYVOL

Mount the volume MYVOL.

nlvm volume mount MYVOL2 novell

Mount the encrypted volume MYVOL2 on the first mount after a reboot. Thereafter until the next reboot, the password is not used to mount the volume. For example:

nlvm volume mount MYVOL2

6.64 Volume Unmount

volume unmount <volume_name>

Dismount a specified NSS volume. This also deactivates the volume before dismounting it.

nlvm [nlvm_options] volume unmount <volume_name>

Command Option

volume_name

Mandatory. Specify the name of the NSS volume to dismount.

Example

MYVOL

Command Example

nlvm volume unmount MYVOL

Dismount the volume MYVOL.

NLVM Examples for the NSS File System

This section provides examples for using the Novell Linux Volume Manager (NLVM) to manage the OES Storage Services (NSS) file system on your Open Enterprise Server (OES) servers.

For information about using NLVM commands to create and manage Linux POSIX volumes on your OES servers, see "Managing Linux Volumes with NLVM Commands" in the OES 2015 SP1: Linux POSIX Volume Administration Guide.

- Section 7.1, "Creating an NSS Pool and Volume," on page 119
- Section 7.2, "Mirroring a Pool Partition," on page 119
- Section 7.3, "Recovering a Mirror where All Elements Report 'Not in Sync'," on page 120
- Section 7.4, "Logging Out of an iSCSI Device that Contains an NSS Pool," on page 121
- Section 7.5, "Creating a Linux Volume on a Device that Contains a Novell Partition," on page 122

7.1 Creating an NSS Pool and Volume

Enter commands at a terminal command prompt as the root user.

Create an NSS pool named $\tt MYPOOL1$ with a size of 100 GB on device /dev/sdb. Create a volume on the new pool named $\tt MYVOL$.

nlvm create pool device=sdb size=100G name=MYPOOL1

nlvm create volume name=MYVOL pool=MYPOOL1

The command to create an NSS pool creates the partition, pool, Device mapper object, (such as / dev/nss/sdb1.1), and activates the pool.

The command to create the volume creates the volume and automatically mounts it if the pool is not shared. If the pool is shared and cluster enabled, you must configure the pool cluster resource and use the OES Cluster Services commands to bring the resource and its volume online.

7.2 Mirroring a Pool Partition

You can mirror an existing NSS pool partition by using the Create RAID command with the part=<existing_partition_name> option as follows:

```
nlvm [nlvm_options] create raid
name=<raid_name>
raid=1
[type=nss|sbd]
part=<pool_partition_name>
device=<device_name>
```

This command specifies the existing pool partition as the first segment of a RAID1 mirror. You must specify the device option one time with the device to use as its mirror. You do not specify a size in the command. The size of the existing partition determines the amount of space that is used for the mirrored segment. The partition type created for the mirror is the same type as the original partition. After you mirror the partition, you manage the RAID1 device by using the normal NSS software RAID management tools and commands.

For example, if POOL1 uses partition sdc1.1, the following command creates an NSS software RAID 1 mirrored device named POOL1RAID1. The pool's existing partition becomes the first segment of the RAID, and its existing data is mirrored to device sdf.

nlvm create raid name=POOL1RAID1 raid=1 part=sdc1.1 device=sdf

7.3 Recovering a Mirror where All Elements Report 'Not in Sync'

If all elements of a mirrored RAID report a status of "not in sync", use the following procedure to recover the mirror.

- 1 Determine which element you believe to be the in-sync element.
- 2 Log in to the server as the root user, then open a terminal console.
- **3** Using the nlvm delete raid segment command, remove all of the elements from the mirror except the element you want to keep.

For each element that you want to remove, enter the following command. When you are prompted to confirm, type yes, then press Enter. Wait for the segment to be removed before you remove the next segment.

```
nlvm --force delete raid <raid_name> segment <segment_number>
```

Use the --force NLVM option to force the deletion of an out-of-sync segment. When you are done, you have a RAID1 device that consists of the single element that you believed to be the in-sync element.

For example, enter

nlvm -f delete raid MYRAID1 segment 0

When prompted to confirm the deletion, type yes, then press Enter.

4 Force the single RAID element to be in sync. At the command prompt, enter

nlvm raid force <raid_name>

5 Add elements back into the mirror as desired by using the nlvm raid expand command. At the command prompt, enter

```
nlvm expand raid <raid_name> device=<device_name>
```

The device option can be specified multiple times to specify additional segments.

7.4 Logging Out of an iSCSI Device that Contains an NSS Pool

Before you log out of an iSCSI device that is used for an NSS pool, you must first unmount the volumes, deactivate the pool, and unmount the pool. Log out of iSCSI immediately after you unmount the pool.

IMPORTANT: The nlvm unmount command removes the pool's Device Mapper
object and allows the device to be disconnected gracefully. Otherwise, a server hang can occur.

- 1 Log in to the server as the root user, then launch a terminal console.
- 2 Launch NSSMU.

nssmu

- **3** Dismount the volumes on the pool.
 - 3a In the NSSMU main menu, select Volumes, then press Enter.
 - **3b** Select the volume, then press F7 to dismount it.
 - **3c** If the pool contains multiple volumes, repeat Step 3b for each volume.
 - **3d** Press Esc to exit the Volumes page.
- 4 Deactivate the pool.
 - 4a In the NSSMU main menu, select Pools, then press Enter.
 - 4b Select the pool, then press F7 to deactivate it.
 - 4c Press Esc to exit the Pools page.
- 5 Press Esc to exit NSSMU.

Ensure that you have exited NSSMU before you continue. It is essential that there be no cached states for device, partition, and pool objects within NSSMU.

6 Use NLVM to unmount the pool.

nlvm unmount <poolname>

An unmounted pool is a temporary state. You must log out of the iSCSI connection immediately after executing the nlvm unmount poolname> command before any NLVM or NSSMU command is executed. As soon as NSSMU is run, NSSMU remounts the pool in order to manage it. In addition, almost any NLVM command that is run after the unmount also causes the pool to be remounted unless you use the -m option.

- 7 Log out of the iSCSI connection.
 - 7a Launch YaST to manage the iSCSI client.

yast2 iscsi-client

7b Select the Connected Targets tab, then select the iSCSI device and click Logout.

7.5 Creating a Linux Volume on a Device that Contains a Novell Partition

As a best practice, disks using Novell partitions should have only Novell partitions on the device. If you mix Novell and Linux partition types on the same device, the recommended method is to create a Linux volume first, and then create the NSS pool.

In OES 11 SP2 and later, you can use the following procedure to create a Linux partition on a device that already contains a Novell type partition, and then specify the Linux partition as the location for a non-clustered Linux volume.

To add a Linux volume to an unshared device with an existing NSS partition and pool on it:

- 1 Log in to the server as the root user, then open a terminal console.
- 2 Create a Linux partition on the device. Enter

nlvm create partition type=<83 |8E> device=<node_name> size=<value[K|M|G|T]|max>

Specify the partition type based on the type of Linux volume you plan to create.

type=83	(Linux	native volume)
type=8E	(Linux	LVM volume)

For example, to create an LVM partition type on device sdd that is 500 GB, enter

nlvm create partition type=8E device=sdd size=500G

3 Unmount all NSS pools on the device. Enter

nlvm unmount pool <poolname>

For example, to dismount POOL1 and POOL2 on device sdd, enter

nlvm unmount pool POOL1 nlvm unmount pool POOL2

- **4** Do any one of the following to allow NLVM to recognize the new Linux storage object on the device for Device Mapper:
 - Mount the pools on the device. For each pool, enter

nlvm mount pool <poolname>

 Rescan the device for storage objects and allow NLVM to automatically mount all pools on the device.

nlvm rescan

- Restart the server.
- **5** Create a non-clustered Linux volume on the new partition.

```
nlvm create linux volume type=<fs_type> part=<partition_name> mp=<mount_path>
[mkopt=<opt1[,opt2,...]>] [mntopt=<opt1[opt2]...]
[lvm] [name=<lvm_volume_name>] [group=<lvm_vg_name>]
[ncp]
```

The volume type must match the type of partition you created in Step 2.

Continuing the example, on a type 8E partition named sdd3, create an Ext3 file system on an ncp-enabled LVM logical volume named MYVOL3. Enter:

nlvm create linux volume type=ext3 part=sdd3 mp=/usr/novell/lvm/myvol3 mntopt=rw lvm name=MYVOL3 ncp

8 NLVM Examples for Clustering with OES Cluster Services

This section provides examples for using the Novell Linux Volume Manager (NLVM) with OES Cluster Services on your Open Enterprise Server (OES) servers.

- Section 8.1, "Creating or Mirroring an SBD Partition," on page 125
- Section 8.2, "Unmirroring a Mirrored SBD Partition with NLVM," on page 137
- Section 8.3, "Deleting an SBD Partition with NLVM," on page 138

8.1 Creating or Mirroring an SBD Partition

If a single node (or group of nodes) somehow becomes isolated from other nodes, a condition called *split brain* results. Each side believes the other has failed, and forms its own cluster view that excludes the nodes it cannot see. Neither side is aware of the existence of the other. If the split brain is allowed to persist, each cluster will fail over the resources of the other. Since both clusters retain access to shared disks, corruption will occur when both clusters mount the same volumes.

OES Cluster Services provides a split-brain detector (SBD) function to detect a split-brain condition and resolve it, thus preventing resources from being loaded concurrently on multiple nodes. The SBD partition contains information about the cluster, nodes, and resources that helps to resolve the split brain condition.

OES Cluster Services requires an SBD partition for a cluster if its nodes use physically shared storage. Typically, you create the SBD when you configure the cluster on the first node. You can alternatively configure an SBD for the cluster after you configure the first node, but before you configure OES Cluster Services on the second node of the cluster. You might also need to delete and re-create an SBD partition if the SBD becomes corrupted or its device fails.

An SBD must exist and the cluster must be enabled for shared disk access before you attempt to create shared storage objects such as pools and volumes in a cluster. NLVM and other NSS management tools need the SBD to detect whether a node is a member of the cluster and to get exclusive locks on physically shared storage.

Typically, you use the OES Cluster Services SBD Utility (sbdutil) to create or delete an SBD partition for a cluster, as described in "Creating or Deleting Cluster SBD Partitions" in the OES 23.4: OES Cluster Services for Linux Administration Guide. However, you can also use NLVM commands in OES 11 SP1 and later to create or delete SBD partitions.

Use the procedures in this section to create a non-mirrored or mirrored SBD partition:

- Section 8.1.1, "Requirements and Guidelines for Creating an SBD Partition," on page 126
- Section 8.1.2, "Creating a Non-Mirrored SBD Partition with NLVM," on page 128
- Section 8.1.3, "Mirroring an Existing SBD Partition with NLVM," on page 132
- Section 8.1.4, "Creating a Mirrored SBD Partition with NLVM," on page 134

8.1.1 Requirements and Guidelines for Creating an SBD Partition

Consider the requirements and guidelines in this section when you create a OES Cluster Services SBD (split-brain detector) partition.

- "Preparing OES Cluster Services" on page 126
- "Using a Shared Disk System" on page 126
- "Preparing a SAN Device" on page 126
- "Working with NLVM Commands in a Cluster" on page 127
- "Initializing and Sharing a Device for the SBD" on page 127
- "Determining the SBD Partition Size" on page 127
- "Replacing an Existing SBD Partition" on page 127

Preparing OES Cluster Services

Before you create an SBD partition for an existing cluster, you must take the cluster down and stop OES Cluster Services software on all nodes. Do not restart OES Cluster Services and rejoin nodes to the cluster until after you create the new SBD and configure the Shared Disks flag attribute for the Cluster object.

You can mirror an existing SBD while the cluster is up and running.

Using a Shared Disk System

You must have a shared disk system (such as a Fibre Channel SAN or an iSCSI SAN) connected to your cluster nodes before you create a split-brain-detector (SBD) partition. For information, see "Shared Disk Configuration Requirements" in the OES 23.4: OES Cluster Services for Linux Administration Guide.

Preparing a SAN Device

Use the SAN storage array software to carve a LUN to use exclusively for the SBD partition. The device should have at least 20 MB of free available space. Connect the LUN device to all nodes in the cluster.

For device fault tolerance, you can use the nlvm create raid command to mirror the SBD partition on another SAN device. Before you mirror the device, you must carve a second LUN of the same size, and connect the LUN device to all nodes in the cluster.

The device you use to create the SBD must not be a software RAID device. A hardware RAID configured in a SAN array is seen as a regular device by the server.

If you attach new devices to the server while it is running, you should scan for new devices on each cluster node to ensure that the devices are recognized by all nodes. Log in as the root user, launch a terminal console, then enter

nlvm -s rescan

Working with NLVM Commands in a Cluster

If an SBD does not exist in the cluster, NLVM cannot detect whether a node is a member of the cluster, and therefore, it cannot get exclusive locks to the physically shared storage. In this state, you must use the -s NLVM option to override the shared locking requirement and force NLVM to execute the commands you use to create the SBD partition. To minimize the risk of possible corruption, you are responsible for ensuring that you have exclusive access to the shared storage at this time.

Initializing and Sharing a Device for the SBD

When you use sbdutil to create an SBD, you must initialize the SAN device that you created for the SBD, and mark it as Shareable for Clustering before you create the SBD partition. When you mark the device as Shareable for Clustering, share information is added to the disk in a free-space partition that is about 4 MB in size. This space becomes part of the SBD partition.

When you use NLVM to create an SBD, the nlvm create partition command can accept an initialized or uninitialized device when you use the type=lad option. NLVM checks the specified device to see if it is initialized, and takes the following actions:

- Uninitialized device: NLVM initializes the device, marks it as Shareable for Clustering, and creates the requested SBD partition.
- Initialized and shared device: NLVM creates the requested SBD partition.
- Initialized and unshared device: NLVM creates the requested SBD partition, but does not alter the shared state. It returns an error warning that the SBD partition is not shared.

You must manually mark the device as Shareable for Clustering after the partition is created. You can use the nlvm share command to share the device.

Determining the SBD Partition Size

When you create the SBD partition by using the nlvm create partition command, you can specify how much free space to use for the SBD, or you can specify the max option to use the entire device. If you specify a device to use as a mirror, the same amount of space is used. If you specify to use the maximum size and the mirror device is bigger than the SBD device, you will not be able to use the excess free space on the mirror for other purposes.

Because an SBD partition must end on a cylinder boundary, the partition size might be slightly smaller than the size you specify. When you use an entire device for the SBD partition, you can use the max option as the size, and let the software determine the size of the partition.

Replacing an Existing SBD Partition

To replace an existing SBD partition, you must first delete the old SBD partition, and then create the new one. To reuse the SBD partition's device, you must remove the SBD partition, and then reinitialize and share the device.

You must take the cluster down and stop OES Cluster Services on all nodes before you delete the existing SBD partition. Do not restart OES Cluster Services and rejoin nodes to the cluster until after you create the new SBD.

8.1.2 Creating a Non-Mirrored SBD Partition with NLVM

Use the procedure in this section to create a new SBD partition. If an SBD partition already exists, you must first delete the SBD as described in Section 8.3, "Deleting an SBD Partition with NLVM," on page 138.

1 Ensure that nobody else is changing any storage on any nodes at this time.

Until the SBD exists and the cluster is set up for shared disk access, you are responsible for ensuring that you have exclusive access to the shared storage.

- 2 Take the cluster down:
 - 2a Log in to any node in the cluster as the root user, then open a terminal console.
 - 2b At the command prompt, enter

cluster down

- 3 On each cluster node, stop OES Cluster Services:
 - **3a** Log in to the cluster node as the root user, then open a terminal console.
 - 3b At the command prompt, enter

rcnovell-ncs stop

- **3c** After you have stopped OES Cluster Services on all nodes, continue with the next step.
- 4 Prepare a SAN device to use for the SBD partition:
 - **4a** Use the SAN storage array software to carve a device to use exclusively for the SBD partition.
 - 4b Attach the device to all nodes in the cluster.
 - 4c On each node, log in as the root user and rescan for devices:

nlvm -s rescan

Use the -s NLVM option to override the shared locking requirement and force the command to execute.

- **5** Log in to any node in the cluster as the root user, then open a terminal console.
- 6 View a list of the devices and identify the leaf node name (such as sdc) of the SAN device that you want to use for the SBD partition. At the command prompt, enter

```
nlvm -s list devices --terse
```

Use the -s NLVM option to override the shared locking requirement and force the command to execute.

The device information shows the leaf node name, the size, the amount of free available space, the partitioning format (such as MSDOS or GPT), the shared state (whether it is marked as Shareable for Clustering), and the RAID state (whether the device is an NSS software RAID device). Do not use an NSS software RAID for the device.

For example, the uninitialized device sdc reports a used and free size of 0 KB, a format of None, and a shared state of No:

Name	Size	Used	Free	Format	Shared	RAID	Enabled
sda	20.00GB	19.99GB	1008KB	MSDOS	No	No	
sdb	1.00GB	400.01MB	623.98MB	MSDOS	No	No	
sdc	102.00MB	0KB	0KB	None	No	No	
sdd	8.00GB	50.01MB	7.95GB	MSDOS	Yes	No	

7 Initialize and share the device. At the command prompt, enter

nlvm -s init <device_name> format=msdos shared

WARNING: Initializing a device destroys all data on the device.

Replace *device_name* with the leaf node name (such as sdc) of the SAN device you want to use as the SBD partition.

Specify a partitioning format of msdos.

Specify the shared option to mark the device as Shareable for Clustering.

Use the -s NLVM option to override the shared locking requirement and force the command to execute.

You can list the devices to visually verify that the device is formatted and shared:

nlvm -s list devices

For example, the formatted device sdc reports values for used and free size, a format of MSDOS, and a shared state of Yes:

Name	Size	Used	Free	Format	Shared	RAID	Enabled
sda	20.00GB	19.99GB	1008KB	MSDOS	No	No	
sdb	1.00GB	400.01MB	623.98MB	MSDOS	No	No	
sdc	102.00MB	16KB	101.98MB	MSDOS	Yes	No	
sdd	8.00GB	50.01MB	7.95GB	MSDOS	Yes	No	

8 Create the SBD partition. At the command prompt, enter (all on the same line):

```
nlvm -s create partition
    type=lad
    device=<device_name>
    size=<value[K|M|G|T]|max>
    label="<cluster_name>"
```

Specify a type of 1ad to create the SBD partition type.

Replace *device_name* with the leaf node name (such as sdc) of the SAN device you want to use as the SBD partition.

Replace value with the amount of space to use for the SBD partition and select a unit of measure as its multiplier, or specify \max to use the entire device. If you specify a value without a multiplier, gigabytes (G) is assumed.

Replace cluster_name with the name of the cluster, such as cluster1. This name must match the name of an existing cluster that has a Cluster object in eDirectory. The name is case sensitive.

Use the -s NLVM option to override the shared locking requirement and force the command to execute.

For example, to create an SBD partition for a cluster named cluster1 on device sdc that has already been initialized and shared, enter

nlvm -s create partition type=1ad device=sdc size=max label="cluster1"

A partition is created named cluster1.sbd. It uses all available free space on the specified device.

9 View a list of partitions and verify that the new partition appears in the list. At the command prompt, enter

nlvm -s list partitions

Use the -s NLVM option to override the shared locking requirement and force the command to execute.

The partition information shows the partition name, the leaf node name of the device, the partition type (1AD), the starting location, and the partition size. Because an SBD partition must end at a cylinder boundary, the partition size might be slightly smaller than the device size, or the size you specified for the partition.

For example, for device sdc that is 102 MB in size, the partition created is 99.59 MB in size:

 Name
 Type
 Start
 Size
 Device

 sda1
 83(Linux)
 2048
 297.00MB
 sda

 sda2
 82Linux_Swap)
 610304
 1.00GB
 sda

 sda3
 83(Linux)
 2715648
 7.99GB
 sda

 cluster1.sbd
 1AD(Cluster)
 32
 99.59MB
 sdc

If you specified the maximum size for the SBD partition, you can list devices again to see that all space on the device is used for the SBD partition:

Name	Size	Used	Free	Format	Shared	RAID	Enabled
sda	20.00GB	19.99GB	1008KB	MSDOS	No	No	
sdb	1.00GB	400.01MB	623.98MB	MSDOS	No	No	
sdc	102.00MB	102.00MB	0KB	MSDOS	Yes	No	
sdd	8.00GB	50.01MB	7.95GB	MSDOS	Yes	No	

10 Modify the Cluster object in eDirectory to enable its NCS: Shared Disk Flag attribute.

This step is required only if the cluster has never had an SBD partition. However, it does no harm to verify that the NCS: Shared Disk Flag attribute is enabled.

10a In a web browser, open iManager, then log in to the eDirectory tree that contains the cluster you want to manage.

IMPORTANT: Log in as an administrator user who has sufficient rights in eDirectory to delete and modify eDirectory objects.

- 10b Select Directory Administration, then select Modify Object.
- **10c** Browse to locate and select the Cluster object of the cluster you want to manage, then click OK.

10d Under Valued Attributes, select the NCS: Shared Disk Flag, then click Edit.

General Other			
/alued Attributes		Unvalued Attributes

10e Select (enable) the NCS: Shared Disk Flag check box, then click OK.

Edit Attribute
NCS:Shared Disk Flag
OK Cancel

- **10f** Click **Apply** to save changes.
- **11** On each cluster node, start OES Cluster Services:
 - **11a** Log in to the cluster node as the root user, then open a terminal console.
 - 11b At the command prompt, enter

rcnovell-ncs start

- **11c** After you have restarted OES Cluster Services on all nodes, continue with the next step.
- **12** On each cluster node, join the cluster. At the command prompt, enter

cluster join

13 (Optional) Continue with Section 8.1.3, "Mirroring an Existing SBD Partition with NLVM," on page 132.

8.1.3 Mirroring an Existing SBD Partition with NLVM

You can mirror an existing OES Cluster Services SBD partition to provide device fault tolerance. It is not necessary to take the cluster down or stop the cluster software.

- 1 Prepare a SAN device to use as the mirror segment for the SBD partition:
 - **1a** Use the SAN storage array software to carve a device that is at least the size of the existing SBD partition's device.
 - **1b** Attach the device to all nodes in the cluster.
 - **1c** On each node, log in as the root user and rescan for devices:

nlvm rescan

- **2** Log in to any member node of the cluster as the root user, then open a terminal console.
- 3 View a list of the devices and identify the leaf node name (such as sde) of the SAN device that you want to use as the mirror for the existing SBD partition. At the command prompt, enter

nlvm list devices

For example, the uninitialized device sde reports a used and free size of 0 KB, a format of None and a shared state of No:

Name	Size	Used	Free	Format	Shared	RAID	Enabled
sda	20.00GB	19.99GB	1008KB	MSDOS	No	No	
sdb	1.00GB	400.01MB	623.98MB	MSDOS	No	No	
sdc	102.00MB	102.00MB	0KB	MSDOS	Yes	No	
sdd	8.00GB	50.01MB	7.95GB	MSDOS	Yes	No	
sde	102.00MB	0KB	0KB	None	No	No	

4 Initialize and share the device. At the command prompt, enter

nlvm init <device_name> format=msdos shared

WARNING: Initializing a device destroys all data on the device.

Replace *device_name* with the leaf node name (such as sde) of the SAN device you want to use as the mirror for the existing SBD partition.

Specify a partitioning format of msdos.

Specify the shared option to mark the device as Shareable for Clustering.

You can list the devices to visually verify that the device is formatted and shared:

nlvm list devices

For example, the formatted device sde reports a format of MSDOS and a shared state of Yes:

Name	Size	Used	Free	Format	Shared	RAID	Enabled
sda	20.00GB	19.99GB	1008KB	MSDOS	No	No	
sdb	1.00GB	400.01MB	623.98MB	MSDOS	No	No	
sdc	102.00MB	102.00MB	0KB	MSDOS	Yes	No	
sdd	8.00GB	50.01MB	7.95GB	MSDOS	Yes	No	
sde	102.00MB	16KB	101.98MB	MSDOS	Yes	No	

5 Mirror the SBD partition. At the command prompt, enter (all on the same line):

```
nlvm create raid
raid=1
name=<cluster_name>
type=sbd
part=<partition_name>
device=<device_name>
```

Specify a RAID type of 1 for mirroring.

Replace cluster_name with the name of the SBD's cluster, such as cluster1. This name must match the name of an existing cluster that has a Cluster object in eDirectory. The name is case sensitive.

Specify a type of sbd to create SBD partitions on the RAID1 device. The type option must precede the part option in the command.

Replace *partition_name* with the partition name of the existing SBD partition.

Replace *device_name* with the leaf node name (such as sde) of the SAN device you want to use as the mirror for the existing SBD partition. The device must be at least the same size as the partition you want to mirror.

You do not specify a size in the command. The size of the existing partition determines the amount of space that is used for the mirrored segment.

For example, to mirror the SBD partition cluster1.sbd with device sde for a cluster named cluster1, enter

```
nlvm create raid raid=1 type=sbd name=cluster1 part=cluster1.sbd
device=sde
```

For our example, a RAID1 (mirror) device is created named cluster1.sbd that is made up of device sdc and device sde. The existing SBD partition is renamed from cluster1.sbd to cluster1.msbd0. A new partition named cluster1.msbd1 is created on device sde.

6 View a list of devices to verify the current state of both devices and to verify that a RAID1 device named cluster1.sbd was created. At the command prompt, enter

nlvm list devices

The entries of interest in the devices list are the devices that you use for the SBD partition (such as sdc and sde) and the newly created RAID1 device:

Name	Size	Used	Free	Format	Shared	RAID	Enabled
sda	20.00GB	19.99GB	1008KB	MSDOS	No	No	
sdb	1.00GB	400.01MB	623.98MB	MSDOS	No	No	
sdc	102.00MB	102.00MB	0KB	MSDOS	Yes	No	
sdd	8.00GB	50.01MB	7.95GB	MSDOS	Yes	No	
sde	102.00MB	102.00MB	0KB	MSDOS	Yes	No	
cluster1.sbd	99.57MB	97.57MB	0KB	None	Yes	1	Yes

7 View a list of partitions to verify the status of mirrored SBD partitions cluster1.msbd0 and cluster1.msbd1. At the command prompt, enter

nlvm list partitions

The entries of interest in the list are cluster1.msbd0 and cluster1.msbd1:

Name	Туре	Start	Size	Device
sdal	83(Linux)	2048	297.00MB	sda
sda2	82Linux_Swap)	610304	1.00GB	sda
sda3	83(Linux)	2715648	7.99GB	sda
cluster1.msbd0	1AD(Cluster)	32	99.59MB	sdc
cluster1.msbd1	1AD(Cluster)	32	99.59MB	sde

8.1.4 Creating a Mirrored SBD Partition with NLVM

You can create a mirrored OES Cluster Services SBD partition to provide device fault tolerance for the SBD. You must take the cluster down and stop the cluster software. If an SBD partition already exists, you must first delete the SBD as described in Section 8.3, "Deleting an SBD Partition with NLVM," on page 138.

Use the procedure in this section to create a new mirrored SBD partition by using NLVM commands.

1 Ensure that nobody else is changing any storage on any nodes at this time.

Until the SBD exists and the cluster is set up for shared disk access, you are responsible for ensuring that you have exclusive access to the shared storage.

- 2 Take the cluster down:
 - 2a Log in to any node in the cluster as the root user, then open a terminal console.
 - 2b At the command prompt, enter

cluster down

- 3 On each cluster node, stop OES Cluster Services:
 - **3a** Log in to the cluster node as the root user, then open a terminal console.
 - 3b At the command prompt, enter

rcnovell-ncs stop

- **3c** After you have stopped OES Cluster Services on all nodes, continue with the next step.
- 4 Prepare two SAN devices to use for the mirrored SBD partition:
 - **4a** Use the SAN storage array software to carve two devices of equal size to use exclusively for the mirrored SBD partition.
 - 4b Attach the devices to all nodes in the cluster.
 - 4c On each node, log in as the root user and rescan for devices:

nlvm -s rescan

Use the $-{\rm s}$ NLVM option to override the shared locking requirement and force the command to execute.

- 5 Log in to any node in the cluster as the root user, then open a terminal console.
- 6 View a list of the devices and identify the leaf node name (such as sdc) of the two SAN devices that you want to use for the mirrored SBD partition. At the command prompt, enter

nlvm -s list devices

Use the -s NLVM option to override the shared locking requirement and force the command to execute.

The device information shows the leaf node name, the size, the amount of free available space, the partitioning format (such as MSDOS or GPT), the shared state (whether it is marked as Shareable for Clustering), and the RAID state (whether the device is an NSS software RAID device). Do not use an NSS software RAID for the device.

7 Initialize and share the two devices. At the command prompt, enter

nlvm -s init <device_name1>,<device_name2> format=msdos shared

WARNING: Initializing a device destroys all data on the device.

Replace *device_name1* and *device_name2* with the leaf node names (such as sdc and sdd) of the two SAN devices you want to use for the mirrored SBD partition.

Specify a partitioning format of msdos.

Specify the shared option to mark the devices as Shareable for Clustering.

Use the -s NLVM option to override the shared locking requirement and force the command to execute.

For example, to initialize devices sdc and sdd, enter

```
nlvm -s init sdc,sdd format=msdos shared
```

You can list the devices to visually verify that the device is formatted and shared:

```
nlvm -s list devices
```

8 Create the mirrored SBD partition. At the command prompt, enter (all on the same line):

```
nlvm -s create raid
raid=1
type=sbd
name=<cluster_name>
device=<device_name1> size=max
device=<device_name2>
```

Specify a RAID type of 1 for mirroring.

Specify a type of sbd to create SBD partitions on the RAID1 device.

Replace cluster_name with the name of the cluster, such as cluster1. This name must match the name of an existing cluster that has a Cluster object in eDirectory. The name is case sensitive.

Replace *device_name1* and *device_name2* with the leaf node names (such as sdc and sdd) of the two SAN devices you want to use for the mirrored SBD partition. The cluster1.msbd0 mirrored SBD partition is created on the first device option instance in the command. The cluster1.msbd1 mirrored SBD partition is created on the second device option instance in the command.

Specify a size of max to use all of the available space. Specify the size only once. Both devices should be the same size; however, if they are not, the size of the RAID segments is determined by the size of the smaller device.

Use the -s NLVM option to override the shared locking requirement and force the command to execute.

For example, to create a mirrored SBD for a cluster named cluster1 with devices sdc and sdd that have already been initialized and shared, enter

nlvm -s create raid raid=1 type=sbd name="cluster1" device=sdc size=max device=sdd

A RAID1 device is created named cluster1.sbd. The cluster1.msbd0 partition is created on device sdc. The cluster1.msbd1 partition is created on device sdd.

9 View a list of devices to verify the current state of both devices and to verify that a RAID1 device named cluster1.sbd was created. At the command prompt, enter

```
nlvm -s list devices
```

10 View a list of partitions and verify that the new partitions appear in the list. At the command prompt, enter

nlvm -s list partitions

The partition information shows the partition name, the leaf node name of the device, the partition type (1AD), the starting location, and the partition size. Because an SBD partition must end at a cylinder boundary, the partition size might be slightly smaller than the device size, or the size you specified for the partition.

You can list devices again to see the amount of space that is unused beyond the cylinder boundary. Our example devices show 2.39 MB of free space after the partition is created, as shown in Step 9.

11 Modify the Cluster object in eDirectory to enable its NCS: Shared Disk Flag attribute.

This step is required only if the cluster has never had an SBD partition. However, it does no harm to verify that the NCS: Shared Disk Flag attribute is enabled.

11a In a web browser, open iManager, then log in to the eDirectory tree that contains the cluster you want to manage.

IMPORTANT: Log in as an administrator user who has sufficient rights in eDirectory to delete and modify eDirectory objects.

- 11b Select Directory Administration, then select Modify Object.
- **11c** Browse to locate and select the Cluster object of the cluster you want to manage, then click OK.
- 11d Under Valued Attributes, select the NCS: Shared Disk Flag, then click Edit.

Modify Object: Secluster.novell General Other Valued Attributes Unvalued Attributes GUID ACL modifiersName Audit:File Link NCS:CRM Quorum Certificate Validity Interval NCS:CRM Quorum Timeout Cross Certificate Pair NCS:CRM Resource Priority DirXML-Associations NCS:Email Addresses Equivalent To Me NCS:Email Filter Last Referenced Time NCS:GIPC Heartbeat masvAuthorizedRange NCS:GIPC Master Watchdog masvDefaultRange NCS:GIPC Max Retransmits masvProposedLabel NCS:GIPC Slave Watchdog NCS:CRM HMO Setting NCS:GIPC Tolerance NCS:CRM Load Script NCS:Network Address NCS:CRM Load Timeout NCS:Port Number NCS:CRM Unload Script NCS:Revision NCS:CRM Unload Timeout NCS:Shared Disk NCS:GIPC Config Network Address NCS:Node Isolation Script Object Class Other GUID Revision rbsAssignedRoles Used By rbsAssignedRoles2 Edit... Delete OK Cancel Apply Refresh

11e Select (enable) the NCS: Shared Disk Flag check box, then click OK.

dit Attribute	
ICS:Shared Disk Flag	
OK Cancel	

- 11f Click Apply to save changes.
- **12** On each cluster node, start OES Cluster Services:
 - **12a** Log in to the cluster node as the root user, then open a terminal console.
 - 12b At the command prompt, enter

rcnovell-ncs start

- **12c** After you have restarted OES Cluster Services on all nodes, continue with the next step.
- 13 On each cluster node, join the cluster. At the command prompt, enter

cluster join

8.2 Unmirroring a Mirrored SBD Partition with NLVM

Use the procedure in this section to remove the mirrored segment from a mirrored SBD partition, and then to remove the single element mirror from the SBD. This leaves a single device that contains an SBD partition.

- 1 Log in to any node as the root user, then launch a terminal console.
- 2 Delete the mirrored segment from the mirrored SBD partition. At the command prompt, enter

```
nlvm [--force] [--no-prompt] delete raid <raid_name> segment
<segment_number>
```

You are automatically prompted to confirm the delete action. Respond by typing yes or no, then press Enter. You can use the -no-prompt NLVM option to suppress the confirmation prompt.

Replace *raid_name* with the name of the mirrored SBD RAID device that contains the segment to be deleted, such as cluster1.sbd. The RAID name is case sensitive.

Replace **segment_number** with the segment index (zero relative) to be removed. For a mirrored SBD RAID the possible values are 0 and 1.

Use the --force NLVM option to remove out-of-sync segments.

For example, to delete segment 1 of the cluster1.sbd RAID1 device, enter

nlvm delete raid cluster1.sbd segment 1

3 View a list of partitions and verify that the SBD partition named <cluster_name>.msbd1 has been deleted. At the command prompt, enter

nlvm list partitions

4 View a list of RAIDs and verify that the SBD RAID1 device <cluster_name>.sbd still exists. At the command prompt, enter

nlvm list devices exclude=nonraid

5 Delete the single element mirror from the SBD. At the command prompt, enter

nlvm [--no-prompt] delete raid <raid_name>

You are automatically prompted to confirm the delete action. Respond by typing yes or no, then press Enter. You can use the -no-prompt NLVM option to suppress the confirmation prompt.

Replace *raid_name* with the name of the mirrored SBD RAID device that contains the segment to be deleted, such as cluster1.sbd. The RAID name is case sensitive.

Because the RAID device is now a single element RAID1, this command removes the single element mirror from the SBD, and leaves the SBD partition on the device. The SBD partition is renamed from <cluster_name>.msbd0 to <cluster_name>.sbd, and the RAID1 device <cluster_name>.sbd is deleted.

6 View a list of RAIDs and verify that the SBD RAID1 device <cluster_name>.sbd has been removed. At the command prompt, enter

nlvm list devices exclude=nonraid

7 View a list of partitions and verify that the SBD partition name has been changed from <cluster_name>.msbd0 to <cluster_name>.sbd. At the command prompt, enter

nlvm list partitions

For example, the SBD partition entry is now:

cluster1.sbd device=sdc type=1AD(Cluster) start=32 size=99.59MB(203968)

8.3 Deleting an SBD Partition with NLVM

You might need to delete and re-create a OES Cluster Services SBD partition if the SBD becomes corrupted or its device fails. Use the procedure in this section to delete the SBD partition, and then to create a new SBD partition by using one of the methods in Section 8.1, "Creating or Mirroring an SBD Partition," on page 125.

IMPORTANT: You must take the cluster down and stop OES Cluster Services on all nodes before you delete the existing SBD partition. Do not restart OES Cluster Services and rejoin nodes to the cluster until after you create a new SBD.

1 Ensure that nobody else is changing any storage on any nodes at this time.

Until the SBD exists and the cluster is set up for shared disk access, you are responsible for ensuring that you have exclusive access to the shared storage.

- 2 Take the cluster down:
 - **2a** Log in to any node in the cluster as the root user, then open a terminal console.
 - 2b At the command prompt, enter

cluster down

- 3 On each cluster node, stop OES Cluster Services:
 - **3a** Log in to the cluster node as the root user, then open a terminal console.
 - 3b At the command prompt, enter

rcnovell-ncs stop

- **3c** After you have stopped OES Cluster Services on all nodes, continue with the next step.
- 4 Log in to any node in the cluster as the root user, then launch a terminal console.
- 5 If the SBD partition is mirrored, unmirror the SBD partition:
 - **5a** Delete the mirrored segment from the mirrored SBD partition. At the command prompt, enter

nlvm -s [--force] [--no-prompt] delete raid <raid_name> segment <segment_number>

You are automatically prompted to confirm the delete action. Respond by typing yes or no, then press Enter. You can use the --no-prompt NLVM option to suppress the confirmation prompt.

Replace *raid_name* with the name of the mirrored SBD RAID device that contains the segment to be deleted, such as cluster1.sbd. The RAID name is case sensitive.

Replace **segment_number** with the segment index (zero relative) to be removed. For a mirrored SBD RAID the possible values are 0 and 1.

Use the --force NLVM option to remove out-of-sync segments.

Use the $-{\rm s}$ NLVM option to override the shared locking requirement and force the command to execute.

For example, to delete segment 1 of the cluster1.sbd RAID1 device, enter

nlvm -s --force delete raid cluster1.sbd segment 1

5b Delete the single element mirror from the SBD. At the command prompt, enter

nlvm -s [--no-prompt] delete raid <raid_name>

Because the RAID device is now a single element RAID1, this command removes the single element mirror from the SBD, and leaves the SBD partition on the device.

You are automatically prompted to confirm the delete action. Respond by typing yes or no, then press Enter. You can use the -no-prompt NLVM option to suppress the confirmation prompt.

Replace *raid_name* with the name of the mirrored SBD RAID device that contains the segment to be deleted, such as cluster1.sbd. The RAID name is case sensitive.

Use the $-{\rm s}$ NLVM option to override the shared locking requirement and force the command to execute.

For example, to delete the single element mirror from the cluster1.sbd device, enter

nlvm -s delete raid cluster1.sbd

5c View a list of RAIDs and verify that the SBD RAID1 device <cluster_name>.sbd has been removed. At the command prompt, enter

nlvm -s list raids

Use the -s NLVM option to override the shared locking requirement and force the command to execute.

5d View a list of partitions and verify that the SBD partition name has been changed from <cluster_name>.msbd0 to <cluster_name>.sbd. At the command prompt, enter

nlvm -s list partitions

Use the -s NLVM option to override the shared locking requirement and force the command to execute.

For example, the SBD partition entry is now:

```
cluster1.sbd device=sdc type=1AD(Cluster) start=32
size=99.59MB(203968)
```

6 Delete the SBD partition. At the command prompt, enter

nlvm -s delete partition <partition_name>

Replace *partition_name* with the name of the SBD partition, such as cluster1.sbd. The partition name is case sensitive.

Use the -s NLVM option to override the shared locking requirement and force the command to execute.

For example, to delete the single element mirror from the cluster1.sbd device, enter

```
nlvm -s delete partition cluster1.sbd
```

7 If you plan to reuse the device for the SBD, initialize and share the device. At the command prompt, enter

nlvm -s init <device_name> format=msdos shared

WARNING: Initializing a device destroys all data on the device.

Replace *device_name* with the leaf node name (such as sde) of the SAN device.

Specify a partitioning format of msdos.

Specify the shared option to mark the device as Shareable for Clustering.

Use the -s NLVM option to override the shared locking requirement and force the command to execute.

You can list the devices to visually verify that the device is formatted and shared:

nlvm -s list devices

8 To re-create the SBD partition, continue with Section 8.1, "Creating or Mirroring an SBD Partition," on page 125.

Do not restart OES Cluster services and rejoin nodes to the cluster until after you create the new SBD.

Troubleshooting NLVM

This section identifies common problems and troubleshooting tips for Novell Linux Volume Manager (NLVM) on your Open Enterprise Server (OES) server.

- Section 9.1, "Viewing Error Code Messages," on page 141
- Section 9.2, "Failure to Create an LVM Volume Group," on page 141
- Section 9.3, "Failure to Create a Clustered LVM Volume Group," on page 142
- Section 9.4, "Device Is Not Available for Use in an LVM Volume Group," on page 142
- Section 9.5, "NLVM Pool Move Fails and Deactivates the Pool," on page 142
- Section 9.6, "Error 20897 This node is not a cluster member," on page 142
- Section 9.7, "NLVM Error Codes," on page 143
- Section 9.8, "NSS Error Codes," on page 151

For additional troubleshooting information, see the Micro Focus Technical Support website (http://www.novell.com/support).

9.1 Viewing Error Code Messages

If an error message for a failed NLVM command line operation provides an error code without a corresponding message, you can use the nss /err command to view the message. At a command prompt, enter

nss /err=<error_code_number>

You can also use the following command to view the error code message in the NSS Console (nsscon):

nsscon /ErrorCode=<error_code_number>

Type exit and press Enter to close the NSS console and return to the command prompt.

9.2 Failure to Create an LVM Volume Group

When you create an LVM volume group or clustered LVM volume group, the command fails with the following error:

Error 23384: Not enough free space to handle requested size

This error occurs if any one of the devices you used for the volume group is not initialized. Uninitialized devices report that there is no available free space on the device. Initialize the device and try again.

9.3 Failure to Create a Clustered LVM Volume Group

When you create a clustered Logical Volume Manager (LVM) volume group, the command fails with the following error:

Error 23384: Device /dev/sde is not shared by clvmd

This error can occur if the installed Linux kernel does not contain the latest Clustered LVM software. Clustered LVM requires the Linux kernel 2.6.32.45-0.3 or later. You can get the latest kernel version by using the SUSE Linux Enterprise Server (SLES) update channel for OES.

The correct version of CLVM software is included in the SLES 11 SP2 or later releases.

9.4 Device Is Not Available for Use in an LVM Volume Group

A device cannot be used to create an LVM volume group if any of the following conditions exist:

- The device is not initialized.
- The device contains partitions.
- The device is marked as Shareable for Clustering, which adds a 4 KB partition on the device to store the shared state.

9.5 NLVM Pool Move Fails and Deactivates the Pool

If a hardware error is encountered during an nlvm move, the pool move fails, and the pool is automatically deactivated. Currently, no error is returned, but the pool will not activate. The pool move cannot continue because of the hardware error. You must delete the move to clear the move:

nlvm delete move [<poolname>] <movename>]

After the move is deleted, you can activate the pool.

Because of the hardware error, you cannot use the nlvm move command to move the pool. You can move the pool's data to another SAN device by restoring files from backup media, or by copying the files from the old pool to a new pool.

9.6 Error 20897 - This node is not a cluster member

If OES Cluster Services is installed on a node, but an SBD does not exist, NLVM commands return the following error:

Error 20897 - This node is not a cluster member.

In a OES Cluster Services cluster, NLVM uses the cluster's SBD to detect whether a node is a cluster member and to lock against concurrent changes to physically shared storage. Without an SBD, NLVM cannot detect whether a node is a member of the cluster and cannot acquire the locks it needs to execute tasks. In this state, you can use the -s option with NLVM commands to prepare a device and create an SBD partition. To minimize the risk of corruption, you must ensure that nobody else is changing any storage on any nodes at the same time.

For information about creating an SBD partition by using NLVM commands, see Section 8.1, "Creating or Mirroring an SBD Partition," on page 125.

9.7 NLVM Error Codes

Use the information in this section to manage your storage when Novell Linux Volume Manager (NLVM) error conditions exist. NLVM error codes are usually displayed in positive decimal numbers with a message and a status= prefix. For example:

Pool is not active: status=23357

- Section 9.7.1, "NLVM Error List," on page 143
- Section 9.7.2, "NLVM Error Descriptions," on page 145

9.7.1 NLVM Error List

NLVM error code numbers can be categorized as follows:

- NLVM General Errors (23300 to 23309)
 - 23300 zERR NLVM LOCKED
 - 23301 zERR NLVM BOOT DEVICE
 - 23302 ZERR NLVM DEVICE HAS RAID
 - 23303 zERR NLVM NO LOCK
 - 23304 zERR NLVM VLDB SYMBOL ERROR
 - 23305 zERR NLVM NOT PERMITTED
 - 23306 zERR NLVM PARSE ERROR
 - 23307 ZERR NLVM INVALID PARAMETER
- NLVM Device Errors (23310 to 23319)
 - 23310 zERR NLVM CSM DEVICE
 - 23311 zERR NLVM DEVICE NOT FOUND
 - 23312 zERR NLVM PART NOT FOUND
 - 23313 ZERR NLVM READ FAILURE
 - 23314 zERR NLVM WRITE FAILURE
 - 23315 ZERR NLVM PART EXPAND FAILURE
 - 23316 ZERR NLVM SIZE TOO SMALL
 - 23317 zERR NLVM SIZE TOO BIG
 - 23318 ZERR NLVM INVALID PART TYPE
 - 23319 ZERR NLVM DEVICE NOT INIT
- NLVM General File System Errors (23320 to 23329)
 - 23320 zERR NLVM ERROR OPENING DB
 - 23321 zERR NLVM DB MATCH ERROR
 - 23322 zERR NLVM INVALID MODE

- 23323 ZERR NLVM ERROR OPENING CONFIG
- 23324 zERR NLVM ERROR OPENING DEBUG
- 23325 ZERR NLVM ERROR OPENING DEV
- 23326 ZERR NLVM ERROR READING DEV
- 23327 ZERR NLVM INVALID VERSION
- 22328 (reserved)
- 22329 (reserved)
- NLVM Device Mapper Errors (23330 to 23340)
 - 23330 ZERR NLVM ERROR OPENING DM
 - 23331 zERR NLVM DM IOCTL ERROR
 - 23332 ZERR NLVM BAD SEGMENT COUNT
 - 22333 (reserved)
 - 23334 ZERR NLVM BAD IDENTIFIER
 - 23335 ZERR NLVM DM OBJECT NOT FOUND
 - 23336 zERR NLVM INVALID OBJECT
 - 23337 zERR NLVM OBJECT EXISTS
 - 23338 zERR NLVM OBJECT BUSY
 - 23339 ZERR NLVM INVALID TYPE
 - 23340 zERR NLVM LOAD ERROR
- NLVM Create Snapshot Error (23341)
 - 23341 zERR NLVM SNAP NOT FOUND
- NLVM Create Partition Errors (23342 to 23345)
 - 23342 zERR NLVM LIMIT ERROR
 - 23343 zERR NLVM PART CREATE
 - 23344 zERR NLVM PART DELETE
 - 23345 zERR NLVM PART WRITE
- NLVM NSS Pool and Volume Errors (23341 to 23359)
 - 23346 ZERR NLVM UNABLE TO EXPAND POOL
 - 23347 zERR NLVM UNABLE TO CREATE POOL
 - 23348 ZERR NLVM SHARED MISMATCH
 - 23349 zERR NLVM TYPE MISMATCH
 - 23350 zERR NLVM HAS POOL
 - 23351 ZERR NLVM DIRECTORY TOO LONG
 - 23352 ZERR NLVM UNABLE TO CREATE DIR
 - 23353 ZERR NLVM UNABLE TO CREATE NODE
 - 23354 zERR NLVM POOL UPDATE
 - 23355 zERR NLVM POOL MOUNT ERROR
 - 23356 ZERR NLVM POOL MAX SIZE

- 23358 ZERR NLVM GROUP NOT FOUND
- 23359 (reserved)
- NLVM NSS Pool Snapshot Errors (23360 to 23369)
 - 23360 ZERR NLVM SNAPSHOT ERROR
 - 23361 to 23369 (reserved)
- NLVM NSS Software RAID Errors (23370 to 23379)
 - 23370 zERR NLVM DUPLICATE DEVICE
 - 23371 ZERR NLVM MAX ELEMENTS
 - 23372 ZERR NLVM TOO FEW ELEMENTS
 - 23373 ZERR NLVM SIZE MISMATCH
 - 23374 zERR NLVM NOT A RAID
 - 23375 ZERR NLVM NOT A MIRROR
 - 23376 ZERR NLVM TOO MANY PARTITIONS
 - 23377 zERR NLVM RAID NOT IN SYNC
 - 23378 ZERR NLVM RAID NOT ENABLED
 - 23379 ZERR NLVM RAID NONE IN SYNC
- NLVM Linux POSIX Volume Errors (23380 to 23390)
 - 23380 zERR NLVM FSTAB UPDATE
 - 23381 zERR NLVM OPEN ERROR
 - 23382 zERR NLVM NO VOLUME NAME
 - 23383 ZERR NLVM NO IP ADDRESS
 - 23384 zERR NLVM ERROR CREATING LVM VOL
 - 23385 zERR NLVM ERROR MAKING FS
 - 23386 ZERR NLVM ERROR DELETING RES
 - 23387 zERR NLVM ERROR DELETING LVM VOL
 - 23388 ZERR NLVM ERROR SENDING CMD
 - 23389 ZERR NLVM NCP ERROR
 - 23390 ZERR NLVM DUPLICATE MP
- NLVM eDirectory Errors (23391 to 233 92)
 - 23391 ZERR NLVM EDIR OBJECT NOT FOUND
 - 23392 zERR NLVM Invalid CRC
 - 23393 to 23399 (reserved)

9.7.2 NLVM Error Descriptions

- "NLVM General Errors (23300 to 23309)" on page 146
- "NLVM Device Errors (23310 to 23319)" on page 146
- "NLVM General File System Errors (23320 to 23329)" on page 147
- "NLVM Device Mapper Errors (23330 to 23340)" on page 148

- "NLVM Create Snapshot Error (23341)" on page 148
- "NLVM Create Partition Errors (23342 to 23345)" on page 148
- "NLVM NSS Pool and Volume Errors (23346 to 23369)" on page 149
- "NLVM NSS Pool Snapshot Errors (23360 to 23369)" on page 150
- "NLVM NSS Software RAID Errors (23370 to 23379)" on page 150
- "NLVM Linux POSIX Volume Errors (23380 to 23390)" on page 150
- "NLVM eDirectory Errors (23391 to 233 99)" on page 151

NLVM General Errors (23300 to 23309)

23300 zERR NLVM LOCKED

The NLVM lock is already locked.

23301 ZERR NLVM BOOT DEVICE

This device contains /boot, root (/), or swap partitions.

23302 ZERR NLVM DEVICE HAS RAID

This device contains RAID partitions.

23303 ZERR NLVM NO LOCK

A function was called without the NLVM lock.

23304 ZERR NLVM VLDB SYMBOL ERROR

An error occurred when importing the OES Distributed File Services (DFS) VLDB (volume location database) library or functions.

23305 ZERR NLVM NOT PERMITTED

This request is not permitted.

23306 ZERR NLVM PARSE ERROR

An error occurred when parsing the data.

23307 ZERR NLVM INVALID PARAMETER

An invalid parameter was passed in.

NLVM Device Errors (23310 to 23319)

23310 ZERR NLVM CSM DEVICE

This device contains a Cluster Segment Manager (CSM) container.

23311 ZERR NLVM DEVICE NOT FOUND

The device was not found in NLVM.

23312 ZERR NLVM PART NOT FOUND

The partition was not found in NLVM.

23313 ZERR NLVM READ FAILURE

An error occurred while reading a stamp from the disk.

23314 ZERR NLVM WRITE FAILURE

An error occurred while writing a stamp to the disk.

23315 ZERR NLVM PART EXPAND FAILURE

An error occurred while expanding the partition.

23316 ZERR NLVM SIZE TOO SMALL

The specified size is too small.

23317 ZERR NLVM SIZE TOO BIG

Unable to find a space big enough for the request.

23318 ZERR NLVM INVALID PART TYPE

The specified partition type is invalid.

23319 ZERR NLVM DEVICE NOT INIT

The device is not initialized.

NLVM General File System Errors (23320 to 23329)

23320 ZERR NLVM ERROR OPENING DB

An error occurred while opening the database file.

23321 ZERR NLVM DB MATCH ERROR

The current object does not match the database object.

23322 ZERR NLVM INVALID MODE

Invalid mode opening the database file.

23323 ZERR NLVM ERROR OPENING CONFIG

An error occurred while opening the NLVM configuration file.

23324 ZERR NLVM ERROR OPENING DEBUG

An error occurred while opening the NLVM debug file.

23325 ZERR NLVM ERROR OPENING DEV

An error occurred while opening the device for I/O.

23326 ZERR NLVM ERROR READING DEV

An error occurred while reading from the device.

23327 ZERR NLVM INVALID VERSION

The stamps have an unsupported version.

22328 (reserved)

Not used.

22329 (reserved)

Not used.

NLVM Device Mapper Errors (23330 to 23340)

23330 ZERR NLVM ERROR OPENING DM

An error occurred while opening the Device Mapper.

23331 ZERR NLVM DM IOCTL ERROR

An error occurred while sending Device Mapper I/O Control (ioctl).

23332 ZERR NLVM BAD SEGMENT COUNT

A segment count mismatch occurred.

22333 (reserved)

Not used.

23334 ZERR NLVM BAD IDENTIFIER

The object identifier does not match a Device Mapper object ID.

23335 ZERR NLVM DM OBJECT NOT FOUND

The Device Mapper object was not found.

23336 zERR NLVM INVALID OBJECT

The object is invalid.

23337 ZERR NLVM OBJECT EXISTS

The object already exists in Device Mapper.

23338 ZERR NLVM OBJECT BUSY

The object is busy.

23339 ZERR NLVM INVALID TYPE

Invalid type parameter.

23340 ZERR NLVM LOAD ERROR

An error occurred while loading a module.

NLVM Create Snapshot Error (23341)

23341 zERR NLVM SNAP NOT FOUND

The NSS pool snapshot was not found.

NLVM Create Partition Errors (23342 to 23345)

23342 ZERR NLVM LIMIT ERROR

An error occurred while getting the device limits.

23343 ZERR NLVM PART CREATE

An error occurred while creating a partition object.

23344 ZERR NLVM PART DELETE

An error occurred while deleting a partition object.

23345 ZERR NLVM PART WRITE

An error occurred while writing to a partition object.

NLVM NSS Pool and Volume Errors (23346 to 23369)

23346 ZERR NLVM UNABLE TO EXPAND POOL

Unable to expand the NSS pool.

23347 ZERR NLVM UNABLE TO CREATE POOL

Unable to create the NSS pool.

23348 ZERR NLVM SHARED MISMATCH

The shared states do not match.

23349 ZERR NLVM TYPE MISMATCH

The partition types do not match.

23350 ZERR NLVM HAS POOL

The partition already has an NSS pool.

23351 ZERR NLVM DIRECTORY TOO LONG

The specified directory is too long.

23352 ZERR NLVM UNABLE TO CREATE DIR

Unable to create the directory.

23353 ZERR NLVM UNABLE TO CREATE NODE

Unable to create the device node.

23354 ZERR NLVM POOL UPDATE

An error occurred while updating the NSS pool.

23355 ZERR NLVM POOL MOUNT ERROR

An error occurred while updating the NSS pool.

23356 ZERR NLVM POOL MAX SIZE

The NSS pool is already at the maximum size.

23357 ZERR NLVM POOL NOT ACTIVE

The NSS pool is not active.

23358 ZERR NLVM GROUP NOT FOUND

The group was not found in NLVM.

23359 (reserved)

Not used.

NLVM NSS Pool Snapshot Errors (23360 to 23369)

23360 ZERR NLVM SNAPSHOT ERROR

A pool snapshot error occurred.

23361 to 23369 (reserved)

Not used.

NLVM NSS Software RAID Errors (23370 to 23379)

23370 ZERR NLVM DUPLICATE DEVICE

The device is already used in this RAID.

23371 ZERR NLVM MAX ELEMENTS

The RAID already has the maximum number of elements.

23372 ZERR NLVM TOO FEW ELEMENTS

There are too few elements to create the RAID.

23373 ZERR NLVM SIZE MISMATCH

The element sizes do not match.

23374 zERR NLVM NOT A RAID

The device is not a RAID device.

23375 ZERR NLVM NOT A MIRROR

The device is not a RAID1 device.

23376 ZERR NLVM TOO MANY PARTITIONS

You are trying to add too many partitions to a RAID.

23377 ZERR NLVM RAID NOT IN SYNC

The RAID is not in sync.

23378 zERR NLVM RAID NOT ENABLED

The RAID is not enabled.

23379 ZERR NLVM RAID NONE IN SYNC

No partition of the RAID device is in sync.

NLVM Linux POSIX Volume Errors (23380 to 23390)

23380 ZERR NLVM FSTAB UPDATE

An error occurred while updating the /etc/fstab file.

23381 ZERR NLVM OPEN ERROR

An error occurred while opening the file.

23382 ZERR NLVM NO VOLUME NAME

No volume name was specified.

23383 ZERR NLVM NO IP ADDRESS

No IP address was specified.

23384 ZERR NLVM ERROR CREATING LVM VOL

An error occurred while creating the LVM2 volume.

23385 ZERR NLVM ERROR MAKING FS

An error occurred while making the file system on a volume.

23386 ZERR NLVM ERROR DELETING RES

An error occurred while deleting a cluster resource for a volume.

23387 ZERR NLVM ERROR DELETING LVM VOL

An error occurred while deleting the LVM2 volume.

23388 ZERR NLVM ERROR SENDING CMD

An error occurred while sending the XML command.

23389 ZERR NLVM NCP ERROR

An error occurred while adding a volume to NCP (NetWare Core Protocol).

23390 ZERR NLVM DUPLICATE MP

A duplicate mount point was specified.

NLVM eDirectory Errors (23391 to 233 99)

23391 ZERR NLVM EDIR OBJECT NOT FOUND

The eDirectory object was not found.

23392 zERR NLVM Invalid CRC

Invalid CRC (cyclic redundancy check) in GPT (GUID partition table) partitions.

23393 to 23399 (reserved)

Not used.

9.8 NSS Error Codes

For information about OES Storage Services error codes, see the OES Storage Services Error Codes (http://www.novell.com/documentation/nwec/nwec/data/al3s3ui.html).

10 Security Considerations

This section describes the security considerations for the Novell Linux Volume Manager (NLVM) on a Open Enterprise Server (OES) server.

- Section 10.1, "Root User Privileges," on page 153
- Section 10.2, "Files," on page 153

10.1 Root User Privileges

The Linux system root user privileges are required to use NLVM commands.

10.2 Files

/dev/nss/

Location where NSS software RAID and SBD partition device mapper objects are created.

/dev/pool/

Location where NSS pool device mapper objects are created.

/etc/opt/novell/nss/nlvm.conf

Location of the NLVM configuration file.

/opt/novell/nss/mnt/.pools/

Location where NSS pool objects are mounted.

/opt/novell/nss/nlvm/

Location of the NLVM storage configuration database files. The database files are named nlvm.<number.>db, such as nlvm.db, nlvm.1.db, and so on. The default is to keep the 10 most recent files. The number of NLVM database files to keep is set in the /etc/opt/novell/ nss/nlvm.conf file.

/opt/novell/nss/sbin/nlvm

Location of the NLVM utility. It also has a link in the sbin directory so that it is in the search path.

/var/opt/novell/log/nss/debug/

Location of the debug log files when debug is enabled. The debug files are named nlvm_debug.<number.>log, such as nlvm_debug.log, nlvm_debug.l.log, and so on. The default is to keep the 10 most recent files. The number of debug log files to keep is set in the /etc/opt/novell/nss/nlvm.conf file.

/var/run/novell-nss/nlvm.lock

Local lock file for NLVM.

A Configuring Settings for the NLVM Library

The Novell Linux Volume Manager (NLVM) library software has some configurable settings that are exposed in the /etc/opt/novell/nss/nlvm.conf file. The default settings are automatically configured. To modify the default behavior, use the options described in Table A-1.

Parameter	Description
Debug on	If this line is enabled, the command allows the debug feature of the NLVM utility to run every time without needing to use the -d option.
	The default is off (commented out). You can enable debug as needed by using the $-d$ option when you start the utility.
	To enable debug to run every time, you can uncomment the Debug on command in the nlvm.conf file.
	To return to the default debug behavior with the $-d$ option, you can comment out the $Debug$ on command again.
Debug files 10	If this line is enabled, the command specifies the number of NLVM debug log files to keep before deleting the oldest file. A log file shows actions that were performed by the NLVM library.
	The default is to keep the 10 most recent files. The minimum value is 1. The default setting applies when the command is commented out.
	To modify the number of files kept, uncomment the line and specify a new value.
	To use the default setting, comment out the command again.
	When debug runs, a debug log file is opened in the /var/opt/ novell/log/nss/debug directory. The debug files are named nlvm_debug. <number.>log, such as nlvm_debug.log, nlvm_debug.1.log, and so on.</number.>

 Table A-1
 Default Settings for the NLVM Library

Parameter	Description
Data base files 10	If this line is enabled, the command specifies the number of NLVM database files to keep before deleting the oldest file. Database files are stored every time a change is made to the system with the NLVM library.
	The default is to keep the 10 most recent files. The minimum value is 1. The default setting applies when the command is commented out.
	To modify the number of files kept, uncomment the line and specify a new value.
	To use the default setting, comment out the command.
	When a change is made to the system, a database file is opened in the /opt/novell/nss/nlvm/ directory. The database files are named nlvm. <number.>db, such as nlvm.db, nlvm.1.db, and so on.</number.>
Auto refresh off	If this line is enabled, the command turns off the autorefresh. The system gets its information from the database files. This results in much faster load times for utilities, but might require a refresh within the utility. If the autorefresh is off, a refresh can be triggered by using the $-r$ option when you start the NLVM utility.
	IMPORTANT: If OES Cluster Services is on, the autorefresh is always on.
	The default is that autorefresh is enabled (the line is commented out). This allows the NLVM library to refresh the system each time it is used. The autorefresh picks up any changes to the system that happened outside the library.
Blk_discard_on_delete on	If this parameter is enabled, the command discards the blocks on a thin-provisioned storage disk when you delete a pool on that disk. This allows all the allocated blocks for that pool to be made available to the storage disk.
	By default, this parameter is off (the line is commented out).
